MILK PRODUCTION UP

Montana dairymen produced about 1 percent more milk during the October-December period than a year earlier. Milk cow numbers in the state held steady from year ago levels but a slight increase in production per cow accounted for the higher production.

Compared with the previous quarter (July-September) milk production in the state dropped 5 percent or 4 million pounds.

OCTOBER-DECEMBER MILK PRODUCTION

AREA	MILK COWS 1/		MILK PRODUCTION 2/	
	1981	1982	1981	1982
	--Thousands--		-Million Lbs.-

1/ Quarterly average includes dry cows, excludes heifers not yet fresh. 2/ Excludes milk sucked by calves.

MONTANA CROP VALUES UP

Montana farmers and ranchers harvested crops valued at 1.08 billion dollars in 1982--2 percent above 1981. The higher total value was mainly the result of increased production which more than offset a generally lower price per unit of production in 1982.

MONTANA CROP VALUES -- 1982

CROP	PRODUCTION		VALUE
Winter Wheat	80.6	Mil. Bu.	$282.0 Mil.
Hard Spring Wheat	92.8	Mil. Bu.	324.8 Mil.

Potatoes	1.9	Thous. Cwt.	14.4 Mil.
All Hay	5,105	Thous. Tons	268.0 Mil.
Sweet Cherries	3,400	Tons	1.9 Mil.

RED MEAT PRODUCTION DOWN

Montana's slaughter plants produced 37.3 million pounds of red meat in the October-December period, 20 percent less than the same period last year. Accumulated production for all of 1982 was 27 percent below last year.

October-December cattle slaughter at 31,400 head was 19 percent below a year ago. For all of 1982, cattle slaughter was down 34 percent. Hog slaughter at 118,900 head was down 20 percent. For the entire year, hog slaughter was down 17 percent.

Commercial red meat production for the United States during October through December 1982 totaled 9.66 billion pounds, down 4 percent from the October-December 1981 quarter. Red meat production during 1982, at 37.3 billion pounds, declined 4 percent from 1981. The 1982 production percent change from 1981 by individual components were: beef, up 1 percent; veal, up 2 percent; pork, down 10 percent; lamb and mutton, up 9 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

MORE POTATOES IN STORAGE

Montana producers had 1.78 million cwt in storage on January 1, 1983--9 percent above last year at this time.

There were 174 million cwt of potatoes in storage on January 1, 1983 in the 15 major fall producing states. This was up 6 percent from last January and 18 percent above two years ago. Of the total stocks in the 11 objective yield states 74 percent are russets, 23 percent whites and 3 percent reds.

Farm Finance Condition
1982 Crop Summary
Ag Prices Decline
Hay Stocks Up

FARM FINANCES DETERIORATE

Financial conditions in the farm sector continued to deteriorate in 1982. Major contributing factors were sluggish foreign and domestic economic conditions, large world crop supplies, high interest rates and the cumulative impact of three years of low farm income. The number of farmers in financial distress increased, although it remains very low. Farmers experienced a decline in borrowing capacity because of a 3.9 percent drop in nominal farm equity. Since the decline in borrowing capacity came at a time when receipts were very tight, farmers were pressed to reduce input purchases and capital expenditures and to take other actions to improve their cash flow. The farm sector debt-to-asset ratio is estimated to have increased from 18.5 at the start of 1982 to a record 20.1 percent on January 1, 1983.

Current prospects for significant improvement in farm financial conditions in 1983 are not favorable; returns to agriculture will likely remain relatively low. Production expenses may grow by only 2 to 3 percent, but total cash receipts are not currently expected to increase significantly. Lower feed costs and modest price improvement are expected to enhance profits for livestock and poultry producers. However, crop receipts are likely to decline because of projected large supplies and sluggish demand. Cash flow difficulties will persist; again, those farmers with high debt loads and no alternative sources of income will be hardest hit.

The nominal value of farm assets is likely to decline about 2 percent in 1982, the first such decline since 1953. Real estate values fell for the second year in a row; the forecast 4.2 percent decline is the result of reduced farm income expectations and a generally sluggish economy. Real estate values are forecast to remain unchanged next year.

(See Table Page 4)

1982 CROP SEASON REVIEW

Montana's major crops set record levels of production in 1982. Ample moisture at the critical time was the main reason for the bumper yields.

Actually, the winter wheat crop got off to a slow start because of dry soils during the fall of 1981. Poor germination prospects halted seeding in late September with only 75 percent of the planting done. In October a three week rainy period changed things. Although farmers tried to speed seeding, time ran out and some acreage had to wait for spring seeding.

Moisture continued to accumulate during the fall and winter months at an above normal rate. However, a very cool spring delayed planting of spring wheat and barley until late April and early May--much behind normal. Cold and rainy weather returned in late May and early June delaying the last 20 percent of the spring wheat planting.

Spring planted crops grew slowly because of cool weather but ample moisture was always generally available. When August arrived, maturity was much behind normal but warm days during the month allowed rapid development.

Winter wheat harvest didn't start until August 1 when normally a fourth of the crop would already be in the bin.

The harvest of spring crops was extended later than usual because of delayed maturity and cool, wet weather. Generally, harvest didn't get wrapped up until mid-October. In spite of running behind schedule most of the season nearly all Montana crops produced record or near record yields.

DECEMBER FARM PRICES

Farm prices in Montana weakened in December for practically all commodities--only sheep, lambs, hogs and eggs had increases. Crop price decreases were mostly slight while beef cattle declined moderately.

The overall December prices received index at 133 (1977=100) was 5 points (4 percent) below November, and 9 points (6 percent) below December 1981. The crops price index at 138 is 3 points (2 percent) under November and 16 points (10 percent) under a year ago. The livestock price index at 128 is 9 points (7 percent) under November and 2 points below a year ago.

HAY STOCKS ABOVE LAST YEAR

Hay stocks January 1 on Montana farms and ranches totaled 4,595,000 tons--6 percent more than on the same date last year. The relatively mild weather thus far has eased feeding requirements and hay supplies appear adequate for the winter feeding season. Most livestock were being fed hay or supplements by the first of January.

The U.S. hay stocks on farms January 1 totaled 108 million tons, 8 percent more than a year earlier.

SOVIET GRAIN PRODUCTION and PROSPECTS

The 1982 Soviet grain crop estimate remains unchanged at 180 million tons. It includes 86 million tons of wheat, 85 million coarse grains and 9 million miscellaneous grains and pulses. The estimated area for the crop is also unchanged at 122 million hectares, including 57.0 million each for wheat and coarse grains, and 8.0 million for miscellaneous grains and pulses.

Typically, preliminary production results for the year are announced by the Soviets at the November session of the Supreme Soviet. However, this year, as in 1981, no grain production figure was announced. All 1981 production and yield data for grain were also omitted from the recently published USSR statistical handbook, as well as all other major Soviet publications.

Conditions for the 1983 Soviet winter grain crop have not improved noticeably since last month. In the north, conditions for rye continued favorable, and the weather through early December has been good for the plants to harden well before entering dormancy. In the southern part of European USSR, however, the general pattern of below-normal precipitation has persisted since fall seeding began in August, with the consequence that the crop--primarily winter wheat--has developed poorly. To avoid above-average winterkill and enable the crop to have favorable prospects, a mild winter with above-normal precipitation through next spring is needed.

No additional information on winter seeding or fall plowing has been received. Thus, the estimate of winter grain sowings remains at 33-34 million hectares; the target was about 36 million. The latest figure on fall plowing was more than 101 million hectares as of November1; the target was about 112 million.

WINTER WHEAT SEEDINGS FOR 1983

Montana farmers planted 2.4 million acres of winter wheat this past fall for harvest in 1983--down 2 percent from last year's seeding. The normal pace of winter wheat seeding was slowed by generally dry soil conditions in early September and was further delayed by rains the last of September and the first part of October. The crop was generally reported in good condition going into the winter.

Nationally, growers planted 63 million acres in the fall of 1982 for the 1983 crop--5 percent less than the previous year.

ANOTHER RECORD WHEAT CROP

Montana farmers produced a record all wheat crop of 183.6 million bushels in 1982, 6 percent above the previous record of 172.8 million set last year. Barley production, at 76.4 million bushels, was also at a new record high for the state. Spring planting was delayed by cool, wet weather and was not finished until mid-June in many areas. Despite growth progress running behind schedule most of the season good moisture supplies promoted plant growth and development, and grain crops produced record or near record yields. However, lack of maturity combined with poor drying weather extended harvest of small grains well into October.

Hard red spring wheat, at a record high 92.8 million bushels, was 28 percent above the previous record set last year. Durum production at 10.2 million bushels was 9 percent below last year, but the third largest crop on record. Winter wheat production at 80.6 million bushels was 10 percent below the 1981 total.

The 1982 record barley production of 76.4 million bushels surpassed the previous record of 67.9 million bushels set in 1969. Oats production at 7.7 million bushels was up 58 percent from 1981.

The U.S. all wheat production totaled a record high of 2.8 billion bushels--up slightly from last year. Barley production at a new record high of 522 million bushels was up 9 percent, and oats production at 627 million bushels was up 21 percent from 1981.

End of season statistics for all other crops will be released January 13, 1983.

POTATO PRODUCTION and STOCKS

Montana potato growers produced a 1982 crop 11 percent larger than last year. Total production of 1,924,000 cwt was harvested from 7,400 acres with an average yield of 260 cwt.

The U.S. production of fall potatoes estimated at 305 million cwt was 3 percent more than last year. Harvested acreage totaled 1.09 million acres, an increase of 3 percent from 1981. The average yield was slightly below last year.

Practically all of the Montana 1982 production was in storage on December 1, 1982. There were 1.9 million cwt in storage--14 percent more than last year.

Potato stocks for the 15 major states on December 1, 1982 were estimated at 202 million cwt, 5 percent above last year and 17 percent above 2 years ago.

MONTANA HOG NUMBERS DOWN

The Montana December 1 all hog and pig inventory at 154,000 head was down 23 percent from last year and the lowest since 1965. Hogs on hand for breeding, at 20,000 are down 17 percent while market hogs at 134,000 are down 24 percent from a year ago.

Montana's 1982 pig crop totaled 256,000 head, 23 percent less than the previous year. The spring pig crop (December-May) at 152,000 was down 16 percent and the fall pig crop (June-November) at 104,000 was down 32 percent from a year ago.

Nationally, the December 1, 1982 inventory of all hogs and pigs is estimated at 53.2 million head. This is 9 percent below a year ago and 17 percent less than December 1, 1980. The breeding hog inventory at 7.31 million is 7 percent below last year and down 20 percent from two years ago. The market hog inventory at 45.9 million is 10 percent below a year earlier and 17 percent less than two years ago.

The U.S. pig crop for 1982 totaled 84.1 million head, 10 percent below 1981 and 17 percent below the 1980 pig crop. The December 1981 - May 1982 pig crop, estimated at 41.0 million head, is down 14 percent from a year earlier and 22 percent below the comparable period two years ago.

The June - November 1982 pig crop, estimated at 43.1 million head, is 7 percent fewer than a year ago and 13 percent below the June - November 1980 crop.

U.S. hog producers intend to have 5.45 million sows farrow during the December 1982 - May 1983 period, 3 percent below a year ago and 15 percent fewer than two years ago.

TELEPHONE and ELECTRIC BILLS UP IN 1982

In 1982, farmers and ranchers in Montana paid an average monthly electric bill of $49.20, up 8 percent from the average monthly bill in 1981. Cost per Kilowatt-hour (KWH) increased one half cent from 1981, a 14 percent increase. Average monthly KWH used in Montana decreased 5 percent from 1981.

Another increase for Montana farmers and ranchers this year showed up in the average monthly telephone bill. In 1982 farmers and ranchers paid an average monthly local telephone bill of $11.10. This was a 9 percent increase over last year's monthly average. The total average monthly phone bill (which includes long distance, toll charges, hook up and extension phone) averaged $42.80 in 1982, up 13% from last year.

The NATION'S farmers and ranchers paid an average monthly electric bill of $83.90 in 1982, which was 20% higher than last year's monthly average. Average monthly Kilowatt-hour usage at 1,356 was barely above last year's monthly average. The cost per KWH was up 18% from 1981.

Likewise, the average monthly local telephone bill for U.S. farmers went up 11%, to $12.80 per month in 1982. The total monthly bill increased 14 percent from the 1981 monthly average.

MONTANA FERTILIZER CONSUMPTION INCREASES

Fertilizer consumption in Montana during the year ended June 30, 1982 totaled 392,927 tons, up 15 percent from a year earlier.

Of the primary plant nutrients consumed, 56 percent was nitrogen, 38 percent available phosphate, and 6 percent potassium.

Most of the nitrogen (81%) was applied as direct application materials. Of the total nitrogen direct application material, anhydrous ammonia made up 43 percent, ammonium nitrate 27 percent, urea 17 percent, ammonium sulfate 2 percent and other 11 percent.

Most of the phosphate (89 percent) was applied as a mixture. The most common mixtures were 18-46-0, 11-55-0, and 10-34-0. Ammonium Phosphates (11-48-0, 13-39-0, 16-20-0, 27-14-0, and 21-53-0) were the most common forms of direct application materials.

Fertilizer consumption in the U.S. and Puerto Rico during the year ended June 30, 1982 is placed at 48.7 million tons, down 10 percent from the 54.0 million tons consumed during the 1980/81 year. Nitrogen consumption decreased 7 percent to 11.1 million tons; phosphate usage at 4.8 million tons and potash consumption at 5.6 million tons were each down 11 percent.

SEASON'S GREETINGS

Helena, Montana 59601

In my travels around Montana I have the opportunity to visit with many farmers and ranchers as well as others interested in agriculture. All are very much concerned with the current economic situation in this country. Most, however, concede that we were due for a period of readjustment. Inflation and interest rates were getting out-of-hand, and industrial productivity was too low to be competitive in world markets. Readjustment has proven to be a painful experience with high unemployment and returns that do not cover expenses. Yes, these things are upsetting and for some, tragic but times will get better.

Some very positive things are happening in agriculture. I see better management being stressed. Farmers and ranchers are beginning to see the value of information to help make sound marketing decisions. Use of the computer with software packages to help evaluate information and track performance is about to open a new era of agricultural efficiency. Recent reductions in interest rates and energy costs will help push expenses more in line with income.

The road to recovery is long, but we are indeed fortunate to have had an excellent year for crop and livestock production.

We are proud to be a part of Montana's information resource team. Our purpose is to provide unbiased, reliable data to help you make sound production and marketing decisions. We owe a sincere thank you to all the farmers, ranchers and agribusinessmen who voluntarily provide input information. We look forward to serving you during 1983. We wish you all a Merry Christmas and a happy, more prosperous, New Year.

Lyle H. Pratt,
State Statistician

THE WHEAT SITUATION

PRODUCTION HIGHLIGHTS

The 1982 production, estimated at 2.81 billion bushels, is the largest crop in U.S. history. Although an acreage reduction program was in effect, growers reduced their plantings only 1.7 million acres under the year before. The yield, at 35.6 bushels was a bin busting record. Hard red winter represents 45 percent of the total production for 1982, soft red about 22 percent, hard spring 18 percent, white 10 percent, and durum 5 percent. Compared to last year, hard red winter and hard red spring are up. All other classes went down.

CARRYOVER INCREASES

The carryover next May is projected to reach nearly 1.5 billion bushels--about half of this year's record production and 26 percent above last year's carry-in stocks. Winter wheat accounts for 47 percent of the projected total; hard spring wheat, 30 percent; durum, 10 percent; white, 9 percent; and soft red only 4 percent. The main reason for the low level of soft red carryover stocks is that it is closer to export channels making the class a relative bargain for countries that are not so interested in milling and baking quality.

EXPORT PACE SLOW

Exports for the first quarter of the current marketing year are 12 percent under a year ago. For the entire year ending next May, the export total is expected to be down 7 percent from last year's record, but still 9 percent above the 1980/81 level.

The world economic turndown, the strength of the U.S. dollar, foreign exchange restraints in some importing countries, increased production by most major wheat exporters, and the forecast for reduced wheat imports by the Soviet Union are factors that are dimming export prospects.

To make the United States more competitive in world markets, U.S.D.A. announced a 3 year 'Blended Credit' Export Enhancement Program. Essentially, the program designates $500 million each year in fiscal 1983, 1984 and 1985. A portion of the program includes interest-free direct export credit blended with commercial export financing with repayment guaranteed by the government. All grains are eligible with preference given to those in greatest surplus and causing the greatest outlays from the Treasury.

OUTLOOK FOR 1983 PLANTINGS

TO PLANT OR NOT TO PLANT

The 1983/84 season will be the second successive year that wheat growers must decide whether to participate in an acreage reduction program. Their decisions on what and how much to plant will be based on price expectations for wheat and competing crops, weather, and perceived benefits from complying with program planting restrictions. Provisions of the 1983 program have been expanded to encourage greater producer participation than in 1982 when 48 percent of the 90.7 million wheat acreage base was in compliance.

Some of the major features:

The program is a combination 15-percent acreage reduction plus a 5 percent paid land diversion, which means a producer must reduce 1983 wheat acreage for harvest from the farm's established acreage base by 20 percent to be eligible for program benefits. This compares with a straight 15 percent acreage reduction for the 1982 crop.

At signup time (October 1 - March 31, 1983) a farmer may request an advance of 50 percent of the diversion payment. The diversion payment is $2.70 a bushel, so a farm's advance payment would be $1.35 times the farm's program yield times the acres placed in the diversion program.

Also upon signup, growers may request half of the projected deficiency payment for the 1983 marketing year. Advance payments would equal 32.5 cents a bushel times the farm yield times the planted acreage.

The program provides for a $4.30-a-bushel target price and a $3.65-a-bushel regular loan. Reserve program provisions will be announced at a later date.

MONTANA FARM PRICES WEAKEN

Farm prices in Montana during November were mostly under a year ago. Hog and calf prices were exceptions. November prices were also generally lower than October except that hard spring and durum wheat went up.

Cattle prices weakened as marketings increased. Hog prices remain above year ago levels.

FARM FINANCE UPDATE

The now-familiar list of problems facing farmers--weak demand, large crop supplies, and historically high interest rates--continues to strain the agricultural sector. Although general interest rates are declining, farmers will not see significantly lower bank loan rates for some months. Likewise, while a very moderate recovery in the general economy is still expected, its delay continues to pressure demand for farm products.

Indices of Financial Stress in Agriculture, by Region*

Survey Question	U.S.	Plains	West
Farm loan volume delinquent 30 days or more	3.9	3.7	5.0
Farm borrowers who had bank financing discontinued (6/81 to 6/82)	3.3	3.3	3.3
Farm borrowers whom banks anticipate discontinuing (6/82 to 6/83)	4.4	4.5	2.5
Higher than normal	54.6	55.9	41.7

HOLIDAY GREETINGS

Christmas is comin',
or so I hear told.
The wind is ablowin'
and it's molasses freezin' cold.

Hank's a good hand,
long as the weather is fine,
but once it turns cool,
he starts sippin' the wine.

Ridin' the range,
aherdin' them steers,
that's all he's ever done
in his sixty-one years.

It'll be a rodeo,
he'll hawlar and kick,
when we rope him and dress him
to look like Saint Nick.

Still we know that he loves it,
playing the fat-man of fame,
and if the boss ever fired him,
Christmas would never be the same.

There's more to his Christmas
than most strangers can see.
He charges for fencin',
but his kindness comes free.

Many a Christmas have past
when he weren't nearly so glad,
yet he never lets on
'bout them times what was bad.

As you can tell
from the tale that I've told,
this cowboy ain't rich,
but his heart's made of gold.

So may your Christmas be merry,
your New Year be bright,
and may all of your troubles
keep hid out of sight.

THE LIVESTOCK & MEAT SITUATION

During 1982 there has been less red meat produced by American farmers and ranchers. The main reason is the substantial cut in pork production which has been going down since mid-1980. Beef supplies have held steady or gradually increased during the same period. The red meat deficit has been largely offset by an increase in poultry production until now. For this year and next, total red meat and poultry will be down.

For the first half of 1983, total meat and poultry supplies are expected to total about 1 percent less than the same period in 1982. Beef will likely be up 1 percent, pork down 8 percent, and poultry up 3 percent.

Information available to date, reveals that both cattle and hog producers are not expanding their breeding herds.

On September 1, the hog breeding herd in the 10 major hog states was 13 percent smaller than last year and the second lowest since 1972. Producers said they intend to farrow 10 percent fewer sows this fall and 4 percent fewer this winter.

There are strong indications that the expansion in the beef herd has ceased and may be declining. Cow slaughter continues above a year earlier, particularly in the eastern half of the U.S. Cash flow may be an impelling reason. Also, heifer slaughter from feedlots is up, while feedlot placements continue above year-earlier levels.

The economy still holds some uncertainty about consumer demand which remains cautious with unemployment still over 10 percent.

Not only are producers the recipients of discouraging market signals in the form of "soft" prices, they must also deal with their own set of higher costs -- even if their feed costs are not higher.

FARM INCOME UPDATE

Forecasts of most 1983 farm financial indicators have not changed much since September. Gross farm income is expected to rise 1 to 2 percent, as rising livestock receipts and direct Government payments offset declining crop cash receipts. However, larger production expenses will offset these income gains, leaving net farm income near the middle of the $17 to $21 billion range. Neither cash expenses nor cash income will likely change much in 1982, so net cash income will remain near the 1981 level.

The now-familiar list of problems facing farmers--weak demand, large crop supplies, and historically high interest rates--continues to strain the agricultural sector. Although general interest rates are declining, farmers will not see significantly lower bank loan rates for some months. Likewise, while a very moderate recovery in the general economy is still expected, its delay continues to pressure demand for farm products.

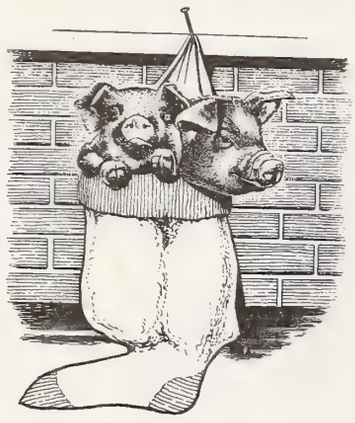
MEAT IMPORTS AHEAD OF LAST YEAR

The U.S. has imported 21 percent more meat during the first 9 months of 1982 compared with the same period in 1981. The total imports represent about 7 percent of the total U.S. production for the period.

Australia brought in 51 percent of the total, New Zealand 31 percent and Canada nearly 10 percent.

Meat imports are subject to the Meat Import Law and include fresh, chilled and frozen beef, veal, mutton and goat meat, and certain prepared items from these meats.

During 1981, the U.S. imported 602,846 metric tons of beef and 195,759 tons of pork.



1981 MEAT EXPORTS RECORD HIGH

Of the total meat exports in 1981, about 10 percent was beef and veal, 13 percent was pork, 27 percent was variety meats and 50 percent was poultry. However, so far in 1982 U.S. meat exports have fallen from the 1981 high because of a stronger dollar, higher prices, increased competition from other suppliers, and soft economic conditions abroad.

U.S. beef exports consist mainly of high-quality beef which goes to restaurants and supermarkets in Japan, Saudi Arabia and other destinations.

EXPORTS OF HIDES & SKINS: A BILLION-DOLLAR BUSINESS

Exports of U.S. hides and skins--and leather-- have made spectacular growth over the past decade or so. These sales, along with those of finished leather and products, now amount to a billion-dollar business--in fact, over $1.2 billion in 1981.

In recent years, the United States has exported one-half to two-thirds of its hide production to more than 60 countries, with Japan the leading customer. Other top buyers are Mexico, Korea, Romania, Canada, Italy, Taiwan, Czechoslovakia, Spain and France.

MORE LEATHER COMING IN THAN GOING OUT

Because of a tremendous imbalance in the trade of leather goods, the U.S. tanning industry has been in a decline.

The number of tanneries and the annual volume of hides processed have dropped sharply--largely because of restrictions on leather imports in other countries.

In 1968, for instance, U.S. tanners processed over 24 million hides, or two-thirds of the available supply from the nation's slaughtered cattle. Since then, the annual volume of hides processed has declined to the current level of 15 million--less than half of the hides available from domestic slaughter.

Per capita U.S. consumption of bovine leather is about eight square feet per year. This is equal to more than 45 million cattle hides. In 1982, U.S. hide production will be below this estimated level.

RECORD CROPS WEAKEN FEED GRAIN PRICES

Prices for all feed grains weakened in October, as harvest of this year's record 8.3 billion-bushel corn crop gained momentum. U.S. feed grain use is expected to increase in 1982/83, but less than supply. Thus, a further buildup in stocks is probable. The 1982/83 corn carry-over price could rise 40 percent to near 3.3 billion bushels.

The record corn crop, a slightly larger harvest of other feed grains, and only a modest increase in use are likely to hold feed grain prices below a year earlier until late next summer. For 1982/83, corn prices are forecast to average $2.20 to $2.40 a bushel, compared with last season's $2.45.

October 1 stocks of feed grains amounted to 86.6 million metric tons, the largest carryover since 1961. However, the carryover may not be as price-depressing as its size might indicate, since most of this grain is isolated from the market until prices rise substantially.

Producer marketing of new crop grains in compliance with the acreage reduction program will significantly affect prices this year. About one-fourth of this year's feed grain harvest is in compliance. Given the outlook for use, a substantial portion of this grain would have to be placed under loan to raise prices to the loan redemption level next summer. However, market conditions this fall are more conducive to farmers' placing grain under loan than at any time in the past 3 decades.

The number of grain-consuming animal units in 1982/83 likely will be slightly larger than in 1981/82. More intensive feeding in response to the relatively high livestock/feed price ratios, particularly for hogs, also may add to feed use. Feed and residual use of corn this year is expected to total 4.2 billion bushels, about 3 percent above the 4.1 billion bushels fed in 1981/82.

CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed November 1 for slaughter market in the seven states preparing monthly estimates totaled 8.12 million head, a 14 percent increase from a year ago and up 4 percent from November 1, 1980. This is the highest November 1 number on feed since 1978.

Marketings of fed cattle during October totaled 1.53 million, an increase of 6 percent from last year but down 3 percent from October 1980.

Placements of cattle and calves on feed in the seven states were 2.59 million, up 27 percent from October 1981 and up 15 percent from two years ago. This is the highest October placements since 1978. Net placements of 2.50 million were up 27 percent and 18 percent from 1981 and 1980, respectively.

Other disappearance totaled 93 thousand compared with 85 thousand during October 1981 and 130 thousand 2 years ago.

BARLEY PRODUCTION UP

Barley production this year is expected to be 516 million bushels, up 8 percent from the 478 million harvested last year. The area harvested this year was 9.2 million acres, the same as last year, but the average yield this year is expected to reach a record 56.2 bushels per acre, compared with 52.3 last year.

The carryover this past June was 150 million bushels. This year's harvest plus about 5 million bushels imported during June - September brought total supply for the quarter to 671 million. Disappearance for June - September amounted to 168 million bushels, comprised of almost 89 million fed, 55 million used for seed and industrial programs, and 24 million exported. Disappearance for the June - May year is expected to total about 482 million bushels.

The price received by farmers for barley averaged $2.20 a bushel during June - September - a drop of 13 percent from the $2.54 average a year earlier. The price of feed barley at Minneapolis dropped steadily from May to October. The decline in corn prices likely had as much to do with the weakness in the price of feed barley as did the barley harvest.

June - September use left 498 million bushels on hand October 1. So, the supply of barley for the October - May period consists of the stocks on hand October 1 plus imports of 7 to 8 million bushels - or about 505 million bushels. Almost 41 million bushels of the October 1 stocks consist of barley from the 1981 and earlier crops that is tied up in the CCC inventory, the FOR, or outstanding CCC loans. This is not available to the market until prices increase substantially.

Compliance with the acreage reduction program by barley producers was relatively high this year. About 38 percent of the acreage for harvest was on farms in compliance. Thus, as much as 196 million bushels of this year's crop may be eligible to receive a CCC loan or to go in the FOR. The regular loan rate on barley is $2.08 a bushel, and the FOR loan rate is $2.37. These rates are not attractive for quality malting barley, but they do represent a significant premium over mid-October prices for feed barley.

By mid October, 32.1 million bushels of 1982-crop barley had been placed under loan - 17 million in reserve and 15.1 million in regular loan. Carryover stocks next June are expected to be about 45 million bushels above the carryover this year. However, the price of feed barley will still depend to a large extent on corn prices. If corn prices are held down by large stocks of free corn, then the rise in feed barley prices likely will also be limited by corn prices and transportation costs.

RECORD HAY CROP IN 1982

A record 152.5 million tons of hay likely will be harvested this year, slightly more than the 143.1 million harvested last year. A record yield of 2.52 tons per acre, 6 percent above the 1982 yield of 2.38, is the main reason. The area harvested increased less than 1 percent -- from 60.2 million acres last year to 60.5 million this year.

Production of alfalfa and alfalfa mixtures of hay rose relatively more than the harvest of other types of hay because of a greater increase in yield per acre. The increase in area harvested was about a half percent for each type of hay.

Adding carryover stocks of 25.2 million tons to this year's hay crop gives a total supply of 177.7 million tons available for the 1982/83 crop year (May-April). This year's supply almost equals the record supply of 177.9 million tons in 1979/80.

STATISTICS BULLETIN AVAILABLE

Montana Agricultural Statistics, 1982, with county data for 1980 and 1981 is now available upon request. The bulletin, published every two years, is a comprehensive tabulation of crop and livestock data, farm income, farm prices, cash receipts, land use, farm labor, climatological, and other farm and ranch data. Free copies may be obtained by writing:

Montana Crop & Livestock Reporting Service

Helena, Montana 59604

FEED DEMAND

The decline in the 1982 spring and fall pig crops means that the grain-consuming animal units (GCAU's) represented by the hog industry will be down from a year earlier. The decline in hog production will be offset by increased cattle feeding, poultry production, and dairying. However, the aggregate number of GCAU's for the 1982/83 feeding year likely will be only slightly larger than those on hand in 1981/82.

INCREASED FEEDING PER ANIMAL UNIT LIKELY

With the sharp drop in feed grain prices this fall, and with prices expected to hold well below a year earlier through next spring and early summer, livestock/feed price ratios will be conducive to more intensive feeding. However, livestock feeder's response is difficult to forecast. For example, cattle feeders have not increased market weights this summer even though the beef-steer/corn price ratio would indicate a possibility of increasing profit by feeding a few additional days. Broiler and hog producers did increase market weights somewhat this summer. Consequently, feed grain use is expected to increase in 1982/83, but by a modest amount.

Wheat Supply & Demand
Food Prices & Farm Income

LARGE CROP and LIVESTOCK SURVEYS START

Crop and livestock surveys will touch base with nearly half of Montana's 24,000 farmers and ranchers during November and December.

On the crops side, questionnaires have already been mailed that ask for detailed information on crop acreage and production by cropping practice. The state's farmers have a large stake in the results of this survey. First, the county yields generated become an important factor in the ASCS county yield formula. Also, crop insurance programs use the yield information generated for payment purposes. The survey figures are also used to help determine crop export policies. The final crop estimates send signals to farm producers that influence farm management decision making.

The hog, sheep and cattle surveys will determine state and national inventories with class and weight breakouts. The July cattle survey revealed a downswing in numbers after a build-up of only 2 years. Whether that downturn was merely a short term dip or the start of a more permanent downslide will be answered.

A strong feature of the Montana Crop and Livestock surveys in recent years is the use of telephone interviewers to call producers who fail to respond by mail. This procedure assures a better sample upon which to base more accurate estimates.

MONTANA FARMERS EYE WORLD MARKETS

Lagging economic activity in many countries with only slight expansion in livestock feed needs is weakening global use of farm products. U.S. exports are also hurt by a strong dollar that raises prices in world markets in spite of lower U.S. prices.

U.S. WHEAT EXPORT ESTIMATE LOWERED

Lagging export sales have led to a 50-million-bushel decline in the 1982/83 wheat export forecast--a 3 percent drop. The expected level for the year is how 1.65 billion bushels, 7 percent below last year, but still the second largest ever.

U.S. carryover stocks are now estimated to be 1.46 billion bushels--one-fourth higher than last year. The farmer-owned reserve stock forecast has been raised 25 million bushels to 950 million.

WORLD WHEAT PRODUCTION INCREASES

World wheat production in 1982/83 is forecast at a record 17.0 billion bushels--up 4 percent from last year. The U.S. share of global production is nearly 17 percent. However, the U.S. will hold about 44 percent of the world carryover stocks.

RUSSIANS TO BUY LESS

Soviet grain buying activity continues to lag well behind last year's record setting pace. The latest estimate of 1982/83 Soviet grain imports is 37 million tons--20 percent below last year.

Soviet wheat imports are forecast to reach 17 million tons, down from the 19.5 million last year. So far, the Soviets have purchased around 9 million tons of wheat--but none from the United States. The Russians will likely take less from Argentina and Australia, but more from the European Economic Community and Canada.

The U.S. has agreed to make available an additional 15 million tons beyond the 8 million originally provided for Soviet purchase during the October 1, 1982--September 30, 1983 year. No proportion of wheat and corn was specified.

U.S. DEPARTMENT OF AGRICULTURE
Helena, Montana 59601

MONTANA DEPARTMENT OF AGRICULTURE

FOOD PRICES and FARM INCOME

Producing food is the whole purpose of farming. In turn, food prices are a critical element in setting farm prices. We all understand that fat cattle won't bring 75 cents a pound if hamburger can't be sold for more than it is now.

Food prices and money spent on food have increased dramatically the past ten years. In fact, more substantially than some thought possible considering the economic climate of the country. Food does remain, however, a rare bargain taking only slightly above 16 percent of disposable personal income....

INCREASE IN TOTAL FOOD EXPDENDITURES COMPARING 1971 & 1981

UNITED STATES	UP 266%

Farm cash receipts have also risen during the last 10 years--but not nearly so great as food prices....

INCREASE IN CASH RECEIPTS FROM FARM MARKETINGS, COMPARING 1971 & 1981

MONTANA	UP 240%

Also, consider that the increase in farm income is even lower than that for cash receipts....

INCREASE IN TOTAL FARM INCOME 1/ COMPARING 1971 & 1981

MONTANA	UP 226%

1/ Includes livestock and livestock products, crops, government payments.

The reason is, of course, the even more rapid increse in farm production expenses that have siphoned off income gains.

Why hasn't farm income kept pace with food prices? Much of the reason is the increases in the food marketing bill....

INCREASES IN THE FOOD MARKETING BILL COMPARING 1971 & 1981

TOTAL MARKETING BILL	UP 260%
Labor	UP 263%
Transportation	UP 269%
Packaging	UP 235%
Fuel & Power	UP 454%
Corporate Profits	UP 308%
Other	UP 222%

Food marketing firms were able to pass part of the increase in costs on to consumers in the form of higher food prices. The increased marketing bill also put downward pressure on farm prices. It's all a matter of relative bargaining strength in the marketplace.

Retail food prices are expected to average about 5 percent higher than last year, the smallest annual increase since 1976. This year's rise is being moderated by the small gain in the farm value of food and by a slowing of food marketing cost increases. The farm value is expected to average around 3 percent above last year's level, the third consecutive year of relatively small increases. The farm-to-retail price spread will be up about 5 percent, the smallest annual rise since 1977.

MONTANA FARM PRICES WEAKEN

Comparing Montana farm prices this October with October a year ago, crop prices were down moderately, cattle prices down slightly, while lamb and hog prices went up.

Leading the price declines from last year were barley and oats, reflecting the bumper yields for these crops. Wheat prices were not down so sharply.

FINANCIAL STRATEGIES IN THE 1970s

When the rate of inflation in the economy changes, the three variables in planning a fianacial strategy--rate of return, cash flow, and risk--become four. Rate of return on indebted assets must be adjusted for the effects of inflation by comparing real rates of return with real interest rates. For the farm sector as a whole, the 1970's was a period in which expansionary farm financial strategies paid off. Combined real (inflation-adjusted) returns from current income and capital gains exceeded the real interest rate, leaving a positive net return on debt-financed expansion. Cash flow, however, depends on current income (which excludes capital gains) and current expenditures (which include principal payments and interest payments at the nominal interest rate).

Real Rates of Return to U.S. Farm Asset Ownership

	Rate of return from current income	*plus* rate of return from real capital gains	**equals** total real rate of return to debt free assets	*minus* real interest rate	**equals** net real return on indebted assets
1970 .	4.0	-1.1	3.0	1.3	1.7
71 .	4.0	4.2	8.2	3.2	5.0
72 .	5.5	8.5	14.0	3.0	11.0
73 .	9.6	11.3	20.9	-1.8	22.7

81 .	3.3	-8.5	-5.2	2.9	-8.1

Note: Totals may not add because of rounding.

WHAT WOULD IT TAKE TO BALANCE WHEAT SUPPLY WITH DEMAND?

During each of the past five marketing years, U.S. wheat use has averaged 69 percent of the total supply available. This has resulted in a carryover that depressed prices to growers. Wheat carryover stocks are essential to orderly marketing in that they assure adequate supplies even during periods of crop failure. The size of an ample carryover is debatable and producers fear that a 'strategic reserve' cannot be properly isolated from market price setting forces.

The carryover buildup does not signal failure of the marketing system. Consider that from 1978 to 1982 production increased 59 percent, but total marketings also increased--nearly 29 percent. The export portion of total use is up 49 percent. Even domestic food use has shown a 5 percent increase. Most experts agree that the export market has the most potential for expansion and much is being done by producers, marketing firms and the government to enlarge this outlet.

In order to bring ending stocks down to more reasonable levels several alternatives appear--some painful and others hard to attain.

Production curbs are one way. To fulfill current demand levels something like 72-73 million acres would need to be harvested at current yields. In the current year, 79 million acres were cut. Thus, a 10 percent acreage reduction would appear to do the job. Perhaps a 70 million acre harvest would be better from the standpoint of cutting into the carryover.

Demand expansion is another approach to solving the surplus dilemma. Some observers claim there is more than enough need in the world to consume all the wheat that could possibly be produced. However, price is a critical factor to much of this demand. Also, both here and abroad, government export and import policies restrain trade. At any rate, total use would have to increase nearly 10 percent in order to match current production and also draw down the surplus. On the surface, a 10 percent imbalance does not appear to be excessive. The problem is that small numbers gradually add up to a burdensome amount.

The following table is present for those growers who want to do their own 'figuring' on the ways to bring the wheat surplus under control.

Supply and utilization:

	Area										
	Planted	Harvested	Yield	Production	Total Supply[2]	Feed and Residual	Other domestic use	Exports	Total use	Ending stocks	Farm price[3]
	Mil. acres		Bu/acre	Mil. bu							$/bu.

HIGHLIGHTS:

Red Meat Production
October 1 Grain Stocks
Farm Income

AGRICULTURAL ECONOMY

Like last year, large crop supplies and a weaker-than-expected economy are dominating prospects for the new marketing year. Record U.S. production is now forecast for corn, wheat, and soybeans. Meanwhile, the July tax cut has not yet boosted the U.S. economy as anticipated. Besides dampening domestic demand, the slow recovery of the U.S. economy is also limiting foreign demand for grains and oilseeds. Growth in U.S. and other developed countries' imports is needed to support economic recovery and demand for farm products in the rest of the world.

The continued combination of slow demand and large crop supplies is expected to boost grain and oilseed stocks again this year. With economic weakness and high interest rates continuing through a third straight year, cumulative financial pressures are leading livestock producers to make conservative production decisions. As a result, total meat and poultry output may remain about the same next year, after falling over 3 percent in 1982.

A relatively small number of large farms account for a substantial share of total agricultural product sales. Only 1 percent of farms had sales of $500,000 or more in 1982, but these farms accounted for 30 percent of total cash receipts. Farms with sales of $100,000 or more represented 12 percent of all farms in 1981, while accounting for 68 percent of cash receipts. By contrast, about 72 percent of all farms had sales of less than $40,000 last year, which together amounted to about 13 percent of total cash receipts.

RECORD WHEAT STOCKS

Wheat stored on Montana farms and in mills and elevators October 1, 1982 totaled 250.1 million bushels--up 24 percent from a year ago and the largest October 1 holdings on record. The record stocks are due to a large carryover from last year's record wheat crop and a potential new record wheat crop in 1982.

Winter wheat stored in the state at 116.8 million bushels was up 18 percent from last year. All spring wheat was up 30 percent with 133.3 million bushels in storage. The durum portion at 17.7 million bushels was up 29 percent from last year.

Barley stocks in all positions at 70.6 million bushels were 41 percent above last year. The October 1 holdings were the second largest on record exceeded only by the 74.0 million bushels on hand October 1, 1970. Oats stocks at 9.7 million bushels were up 89 percent.

Nationally, all wheat stored in all positions on October 1, 1982 totaled a record high 3.01 billion bushels, 10 percent more than the 2.73 billion bushels on hand a year earlier. Farm stocks of 1.43 billion bushels accounted for 48 percent of the total. Wheat stored in off-farm storage facilities totaled 1.58 billion bushels or 52 percent of the total stocks. On October 1 last year, farm stocks of all wheat totaled 1.20 billion bushels, and 1.53 billion bushels were stored in off-farm facilities.

Barley stocks in all positions on October 1, 1982 totaled 498 million bushels, 10 percent more than a year earlier. Stocks of barley stored on farms amounted to 350 million bushels or 70 percent of the total stocks.

Oats stored in all positions on October 1, 1982 totaled 570 million bushels, up 24 percent from October 1, 1981.

INCOME BY SALES CLASS, 1981

Although U.S. farm income in 1981 at 19.6 billion was down 20 percent from 1980, this is only part of the story. Income data by sales class provide another view of the economic well-being of farm people and farm businesses. These data also point out some of the problems faced by Congress and USDA in the administration of farm programs.

The data reveal that a relatively small number of large farms account for a substantial share of total agricultural product sales. Only 1 percent of farms had sales of $500,000 or more in 1981, but these farms accounted for 30 percent of total cash receipts. Farms with sales of $100,000 or more represented 12 percent of all farms in 1981, while accounting for 68 percent of cash receipts. By contrast, about 72 percent of all farms had sales of less than $40,000 last year, which together amounted to about 13 percent of total cash receipts.

Farms with agricultural sales of $40,000 or less--especially those with sales below $10,000--are not as heavily dependent on farming for family income as are larger farms. According to the 1978 Census of Agriculture, 92 percent of farmers with sales of $100,000 or more were primarily engaged in farming, 89 percent of farmers with sales of $40,000 to $99,999, 76 percent with sales of $20,000 to $39,999, and 60 percent with sales of $10,000 to $19,999. But slightly less than 30 percent of farmers with sales of $10,000 or less worked primarily as farmers; of this number, many were likely using their farms partly for retirement purposes. For example, the 1974 Census of Agriculture revealed that 53 percent of farmes with sales of less then $2,500 who reported farming as their primary occupation were 65 years old or older.

Farm operators with 1981 gross sales of less than $100,000 earned more of their net family income from off-farm sources. And although the average farm income of farmers with sales below $40,000 was negative in 1981, their total income--including off-farm income--was positive. Off-farm income per farm with sales of less than $2,500 equaled $22,425, over 30 times greater than the value of agricultural products sold by these farms.

LIVESTOCK SLAUGHTER

Montana's slaughter plants produced 25 million pounds of red meat during the July-September period, 36 percent less than the same period last year according to the Montana Crop and Livestock Reporting Service.

July-September cattle slaughter at 13,600 head was 55 percent less than a year ago. Hog slaughter at 102,500 head was down 15 percent.

Commercial red meat production for the United States during July through September 1982 totaled 9.16 billion pounds, down 2 percent from the July through September 1981 quarter, January-September red meat production, at 27.6 billion pounds, declined 4 percent from the corresponding period last year. The 1982 accumulated production percent changes from last year by individual components were: beef, virtually unchanged; veal, up 4; pork, down 9; lamb and mutton, up 10. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

AGRICULTURAL POLICY

On September 23, the Secretary announced provisions for the 1983 feed grain program. Target prices for 1983-crop feed grains will be $2.86 a bushel for corn, $2.72 for grain sorghum, $2.60 for barley, and $1.60 for oats. Loan rates will be $2.65 a bushel for corn, $2.52 for sorghum, $2.16 for barley, $1.36 for oats, and $2.25 for rye. (There is no target-price program for rye.) In addition, the 1983 program will feature a combined 10-percent acreage reduction and 10-percent paid land diversion.

HIGHLIGHTS:

OCTOBER CROP PRODUCTION FORECAST
FARM PRICES
PASTURE & RANGE EXCELLENT
MILK PRODUCTION UP
BEEF EXPORTS

NATION'S WHEAT PRODUCTION

Nationally, all wheat production is forecast at a record high 2.81 billion bushels, 1 percent above the previous record high set in 1981. Compared with a year earlier, durum wheat production is down 19 percent, other spring wheat is up 9 percent and winter wheat production is up fractionally from last year.

Corn for grain production is forecast at a record high 8.31 billion bushels, virtually unchanged from the September 1 forecast and 1 percent above the previous record high set last year. The 90 percent confidence interval for this production is 7.77 to 8.86 billion bushels.

OCTOBER 1 CROP FORECAST

Harvesting of Montana's huge grain crop is nearly complete. The October 1 production forecast continued to peg most of the state's grain crops at record levels, although the hard spring wheat yield is down 1 bushel from the September forecast. The final, end-of-season tally will be released on December 22, 1982.

Production changes from 1981 are:

Winter Wheat	--	down 2%
Hard Spring Wheat	--	up 31%
Durum	--	down 8%
Barley	--	up 41%
Oats	--	up 83%
All Hay	--	up 10%
Potatoes	--	up 6%
Sugarbeets	--	down 5%
Dry Beans	--	down 32%
Corn for Grain	--	unchanged

STATE DOCUMENTS COLLECTIO

OCT 19 1982

MONTANA STATE LIBRARY
930 E Lyndale Ave
Helena, Montana 596

On October 1 nearly 95 percent of the spring wheat, barley and alfalfa hay was harvested. Sugarbeet lifting was 10 percent complete, potatoes were 35 percent dug, and dry bean and corn silage harvest was 75 percent done.

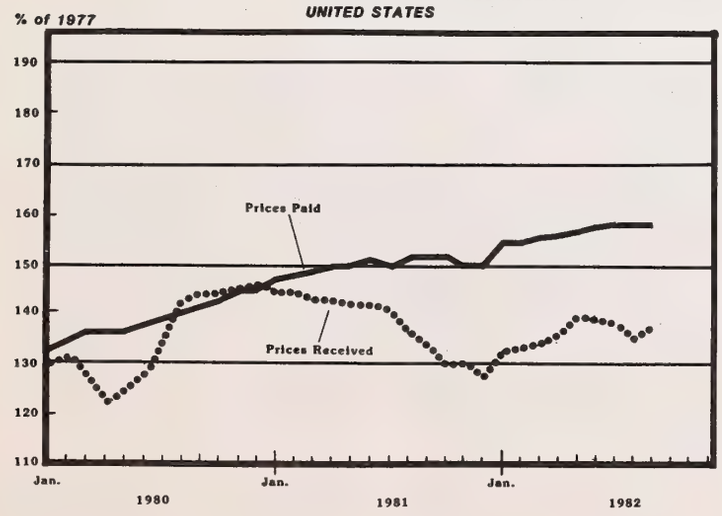
UNITED STATES



FARM PRICES

Farm prices in Montana weakened from August to September for crops but improved slightly for most livestock classes. Winter wheat and hard spring wheat prices dropped moderately while durum, oat and barley price decreases were more severe. Hay prices showed some improvement during the month. Steer and heifer, calf, milk and egg prices went up. Hog prices were unchanged. Prices for cows, sheep and lambs went down.

For the Nation's farmers, prices paid for production items were unchanged, while prices received for the products they sell went up slightly as measured by the prices paid/prices received indexes.

UNITED STATES INDEX SUMMARY

INDEX	Sept. 1981	Aug. 1982	Sept. 1982
Prices Recieved (1977=100) 1/	133	133	136
Prices Paid (1977=100) 2/	151	156	156
Ratio (1977=100) 3/	88	85	87
Parity Ratio (1910-14=100) 4/	58	57	57

1/ Unadjusted all farm products. 2/ For commodities and services, interest, taxes and wage rates. 3/ Prices Received Index divided by Prices Paid Index. 4/ Ratio of prices received to prices paid using 1910-14 prices.

PASTURE & RANGE

Montana's pasture and ranges benefitted from rain and snow over almost the entire state during September. Grazing conditions remain excellent as of October 1, and weather conditions rather than feed supplies will probably cause the movement of livestock from summer pastures.

SURVEY TO PEG PESTICIDE USE

The Montana Crop and Livestock Reporting Service will be contacting a cross-section of the state's farm and ranch producers to determine 1982 levels of specific pesticide usage.

The information is important in assessing the economic necessity of continued use of selected pesticides. USDA is charged with providing Congress with agriculture's side of the pesticide story in order to protect the farmer's interest. This survey will be used to document that need.

MORE MILK PRODUCED

Montana dairymen produced nearly 4 percent more milk during the July-September quarter than a year earlier even though cow numbers held steady. The total of 88 million pounds was 2 million more than the April-June quarter.

WORLD BEEF TRADE

Five countries have historically supplied the U.S. with a lion's share of imported beef products, primarily in the form of 90 percent lean, fresh or frozen, boneless beef. Of this total, Australia is the foremost supplier, exporting nearly 568 million pounds of product worth $566 million to the U.S. in 1981, after a record high of 876 million pounds worth $971 million in 1979. New Zealand is the second largest supplier of imported beef to the U.S., shipping 341 million pounds of product worth about $331 million in 1981.

Australia, New Zealand, and Canada exporters are all reaching 1979 Meat Import Law maximums during 1982. As a result, they have agreed to limit exports for the remainder of the year so that the 1.3 billion pounds "trigger level" will not be exceeded, because this would result in the U.S. imposing quotas. This will necessitate storage of some New Zealand beef until after January 1, 1983.

Since the U.S. is a relatively high income country, as well as being a net importer, the international focus of attention has traditionally been on this prime market. In the past, U.S. imports have ranged from 4-8 percent of total beef production and consumption. In recent years, the amount imported has been increasing, reaching a high of about 10 percent of consumption in 1979. On the other hand, little U.S. product has been exported abroad.

In 1981 the U.S. beef industry exported nearly $700 million of tallow, greases and lard, and $662 million of hides and skins, followed by $306 million in fresh or frozen beef and veal. Total exports amounted to around $2 billion, about the same as the previous year.

HIGHLIGHTS:

Grain Movement
Wheat Exports
Hog Numbers Slip
Crop Production Increases
Cattle Outlook

FARM INCOME UPDATE

Key indicators of the farm sector reveal that 1982 will likely be the third straight year of depressed financial conditions for many farmers. While livestock receipts are projected to be record high this year, crop receipts will likely fall from 1981 levels, despite larger marketings, leading to lower overall cash receipts from farm marketings. So, even though production expenses will rise only modestly compared with large annual increases in recent years, net cash income for 1982 will be approximately $31 billion, 1 percent below that for 1981.

When cash receipt and expense measures are adjusted for noncash income and expenses, the resulting net farm income (before inventory adjustments) is projected to be about $19 billion last year. Inventory adjustments this year are expected to neither add to nor detract from net farm income, leaving net farm income after inventory adjustment still at $19 billion, down from $25.1 billion in 1981 and $20.1 billion in 1980.

WORLD AGRICULTURE and TRADE

U.S. agricultural exports are expected to fall 8 percent in fiscal 1982, to $40.5 billion. this would mark the first year-to-year decline in the value of farm exports since 1969, despite record volume projected at 165 million tons. Another bumper U.S. harvest has put additional downward pressure on export prices. Imports are forecast at about $15 billion, also a decline, pushing the U.S. agricultural trade surplus below $26 billion, down from last year's record $26.6 billion.

MONTANA WHEAT FARMERS EYE SOVIET PROSPECTS

Farmers in Montana are largely at the mercy of two critical elements--weather and exports. This is the reason many wheat farmers have become students of export marketing. It's essential to be informed.

In recent years there are many reasons why the Russian wheat situation has had a direct bearing on the prosperity of Montana's vast wheat industry.

The last two years the Soviets have been importing about 15 percent of their wheat supply. This year, they will import nearly 19 percent, or an amount almost equal to the entire 1982 wheat production from Montana, North and South Dakota, and Washington (24 percent of the U.S. total).

The U.S. share of Russian imports has been increasing the last few years going from 19 percent in 1980/81 to 34 percent in 1981/82. Put still another way, last year Russia imported nearly 40 percent of last year's U.S. wheat exports.

The Russians use about the same amount of wheat each year for seed, industrial and food uses. Dockage and waste (post harvest, transport and storage losses) are more variable but have averaged nearly 434 million bushels a year--similar to an average year's production from Kansas. Feed usage is highly variable but has averaged 12 percent more than food use.

A number of factors could be contributing to the slow start of the Soviet 1982/83 import program:

1. An aggressive, late season 1981/82 import program may have provided the Soviets a substantial grain cushion to work from.

2. The crop outlook in the European USSR is somewhat better than a year ago. This may have resulted in an improved early season flow of grain supplies, lessening the need for imports.

3. The Soviets may be reviewing their spending priorities for the year ahead as they face another year of huge expenditures on grain imports.

WHEAT and BARLEY MOVEMENT

Montana wheat shipped to out-of-state destinations during the six month period December 1981 - May 1982 totaled 52.6 million bushels--up 27 percent from the same period a year ago. Railroads carried the major portion of the wheat shipped out of state--77 percent compared with 70 percent during the same period last year.

Ninety-five percent of the wheat shipped from Montana was bound for western destinations. While this represents only a one percent increase in the percent of the crop shipped westward, the record size of last year's crop resulted in 10.8 million more bushels being sent to western destinations.

Barley shipped out of Montana during the six month period was up 14 percent.

Movement to western destinations at 12.9 million bushels was 15 percent over a year ago. Eastern destinations received 2.1 million bushels--virtually the same as last year.

Both rail and truck shipments were up 14 percent from the same period a year ago.

Grain Movement statistics are made possible through funds provided by the Montana Wheat Research & Marketing Committee through the Montana Department of Agriculture.

Special thanks to the Montana Grain Trade for their cooperation in this project.

CATTLE HIGHLIGHTS

Financial pressures have stalled expansion in the cattle inventory and likely point to continued favorable feeding margins into 1983. Federally inspected cow slaughter during the first half of 1982 rose 11 percent over a year earlier. However, the sharpest increases occurred in areas with mixed crop/livestock operations. In those areas in which cattle enterprises are the main source of income, increases in slaughter ranged from negligible to 8 percent higher.

The number of calves born as a proportion of the January 1, 1982 inventory is expected to tie for the smallest since 1950. Although the number of replacement heifers at the beginning of 1982 was larger than a year earlier, only 28 percent calved and entered the cow herd. This was the lowest since the series began in 1973 and well below the average of 45 percent.

Stronger feeder cattle prices, favorable pasture conditions, anticipated record hay stocks, and an alltime-high grain crop will likely slow the rate of cow slaughter during the remainder of this year. However, cow-calf operators, particularly those on mixed enterprises, may continue to cull cows because of financial stress.

Beef production in second-half 1982 is expected to rise 1 to 2 percent above a year ago. The sharpest year-to-year increases occurred this summer, as a larger number of fed cattle are marketed. Nonfed steer and heifer slaughter is forecast to decline from a year earlier, and only modest increases in cow slaughter are expected.

UNITED STATES JULY 1 CATTLE INVENTORY

Class	1977	1978	1979	1980	1981	1982	1982/81
			1,000 head				*% change*

[1]For 1981, the calf crop is the number of calves born before July 1 plus the number expected to be born after July 1.

MONTANA FARMERS AMONG LEADERS IN PRODUCTION INCREASES

Montana farmers are an important part of the Nation's total food grain production output. Food grain production has increased more in the past 10 years than any other type of crop production. There are several factors involved. Perhaps the most important being a series of good weather years. More acres have been brought into production also. However, the widespread adoptation of progressive farming practices can't be ignored.

HOG INVENTORY DOWN

Inventory of all hogs and pigs on September 1, 1982 in the 10 states conducting quarterly hog surveys is estimated at 41.6 million head, 12 percent below last September and 15 percent less than September 1, 1980. This is the lowest September 1 inventory for the 10 states since 1975.

--Breeding inventory, at 5.55 million head was 13 percent less than a year ago and 15 percent below two years earlier. This is the second lowest breeding inventory during the past 10 years.

--Market hog inventory, at 36.1 million head was 12 percent below last year and 15 percent less than in 1980. This is the lowest September 1 market hog inventory since 1975.

PIG CROP: The June-August 1982 pig crop was 16.2 million head, 11 percent less than last year and 10 percent below two years ago. Sows farrowing averaged 7.39 pigs per litter compared with 7.37 last year and 7.18 two years ago.

FARROWING INTENTIONS: Hog producers in the 10 quarterly states intend to farrow 2.17 million sows during September-November of this year. This is 10 percent less than during the comparable period in 1981 and 17 percent less than two years ago. Farrowing intentions for December 1982-February 1983 quarter are 1.90 million head, 4 percent below the same period a year earlier and 13 percent below two years ago.

EGG PRODUCTION INCREASES

Montana's laying flocks produced 47 million eggs between June 1 and August 31, 1982. The average number of layers was 777,000 during the quarter. Compared with a year earlier, egg production increased 9 percent while layer numbers increased 1 percent.

The Nation's laying flocks produced 17,065 million eggs during the same period--don 1 percent from a year ago. The number of layers averaged 279,247--down 1 percent.

HIGHLIGHTS:

Farm Prices Drop
Pasture & Range Excellent
Record Crop Production
Wheat Situation

U.S. WHEAT PRODUCTION AT RECORD

Nationally, all wheat production is forecast at a record high 2.82 billion bushels, 1 percent above the previous record high set in 1981. Compared with a year earlier, durum wheat production is down 21 percent, other spring wheat is up 10 percent and winter wheat production is up fractionally from last year. The 90 percent confidence interval for the all wheat production forecast is 2.75 to 2.88 billion bushels.

The record crop, combined with the largest carryover in 4 years, may push 1982/83 supplies to a new high. Even though disappearance is expected to match last year's record level, stocks next June are expected to reach 1.4 billion bushels.

MONTANA CROPS AT RECORD LEVELS

Montana's 1982 crop yields are nearly all at record levels. The only exceptions are durum wheat, sugarbeets and dry beans. The latest all wheat production forecast is 13 percent above last year's record, but harvested from 7 percent fewer acres.

September 1 production forecasts are based on producer reports of yield. Also, actual field observations and measurements are used in making the wheat production forecast. Production changes from 1981 are:

Winter Wheat	--	down 2%
Hard Spring Wheat	--	up 35%
Durum	--	down 8%
Barley	--	up 41%
Oats	--	up 83%
All Hay	--	up 5%
Sugarbeets	--	down 5%
Dry Beans	--	down 32%
Corn for Grain	--	unchanged

Winter wheat harvest was about 70 percent complete on September 1 compared with 95 percent last year and a normal of 90 percent. Spring wheat harvest was 30 percent done while progress of the oats and barley harvest was about 45 percent complete--all well behind normal. Although harvest weather has been nearly ideal, cool weather during the spring and early summer delayed growth and maturity.

PASTURE and RANGE

Montana's pasture and ranges remain in excellent condition as of September 1. While less moisture was received during August than during prior spring and summer months, soil moisture conditions are generally above average across the state.

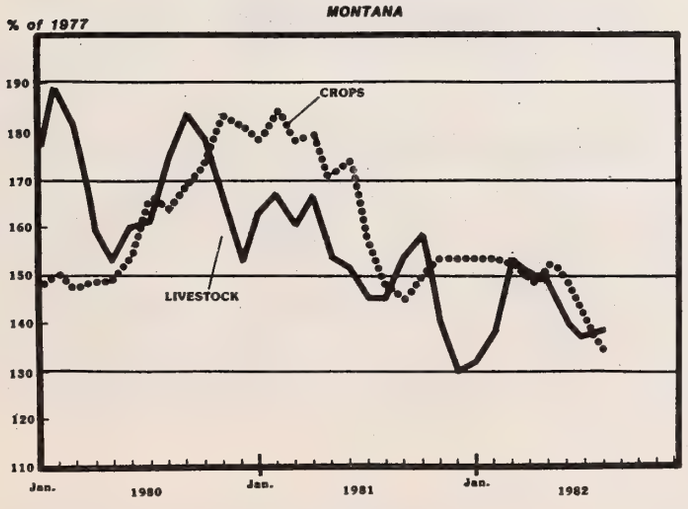
CROP & LIVESTOCK PRICES RECEIVED INDEXES
MONTANA



HOG PRICES THE ONLY BRIGHT SPOT

Mid-August hog prices in Montana were almost 27 percent above year ago levels--the only bright spot on the farm price scene. Grain markets faced with near record supplies and uncertain foreign demand were substantially weaker. Cattle prices were down slightly.

For the Nation, prices farmers pay for commodities and services, interest, taxes and wage rates continued to climb while prices they receive for all farm products went down.

RAIL RATES TO CONTINUE UNCHANGED

Rail rates for grain have remained stable so far this year and are expected to continue at current levels through the third quarter, even though the Interstate Commerce Commission's Cost Recovery Index (CCR) would permit a rise of 0.5 percent in the third quarter. The relatively low demand for rail service (down nearly 9 percent from 1981) and the lack of a rate decrease during the second quarter (when the CCR dropped 1.2 percent) argue against any general increase before October.

WHEAT EXPORTERS VYING FOR WORLD MARKETS

While U.S. wheat policy is reducing acreage for the second straight year, the major foreign competitors for wheat markets--Argentina, Canada, France and Australia--are pursuing policies that could increase production. Furthermore, the expansion of foreign wheat acreage into poorer growing areas will likely make exports--and thus world prices--more volatile in the 1980's.

The United State's competitors in the world wheat market have considerable potential for expanding wheat production, and their output may increase faster than that of U.S. producers during the 1980's. Of the four major competitors, Canada, Australia and Argentina have additional land that can be planted to wheat, although some of this land has poorer soils or less rainfall that would slow yield growth. Area is limited in France, so production gains there will depend on improving yields.

These four countries account for about 45 percent of world wheat exports, slightly more than the United States' average share. The agricultural policies in all four countries are now geared to expanding production and exports. If successful, they will affect U.S. wheat trade, world wheat prices, and the income of American farmers, while also exacerbating the variability in output and exports in each of the wheat exporting countries, including the United States.

PRODUCTION PROSPECTS: OUTPUT GROWTH TO SLOW

The combined wheat outturn of these four countries rose at an annual average rate of 4 percent during the last decade, reaching 72 million metric tons in 1981. Expansion of harvested area--3.1 percent a year--accounted for most of this growth. Wheat yields showed only a small increase despite improved technology, displaying considerable year-to-year variations due to weather.

In the 1980's, these countries' wheat production is projected to expand 3 percent annually, reaching a total of 80 million metric tons by 1990--about the same as projected U.S. output. About half this increase is expected to come from area expansion, achieved through diversion of improved pasture and land currently planted to competing crops. Inadequate moisture will be a limiting factor, but could be offset by applying new production technology.

USSR GRAIN SITUATION AND OUTLOOK

The estimate of the 1982 Soviet grain crop is 170 million tons. Wheat production is estimated at 80 million tons, coarse grains at 81 million and miscellaneous grains and pulses at 9 million. Heavy rains early in the period over the European USSR have abated, benefiting harvest operations. Although, the eastern grain producing region continues dry, some relief has been provided recently by scattered showers. Harvesting progress has lagged this year as wet weather and uneven development slowed harvesters. However, the pace should quicken as the harvest moves into the major spring grain areas.

DOMESTIC USE ESTIMATE UNCHANGED

Large imports this year are expected to generally offset the small crop, maintaining the level of grain supplies. The Soviets typically need around 200 million tons of grain to cover domestic requirements. This does not include an allowance for dockage and waste. In the mid-70's needs grew as more grain was being fed to an expanding livestock sector. The Soviets have reacted to the recent poor crops by drawing down stocks and sharply increasing imports. However, adjustments also were made in domestic use. The past several years have seen a nearly continuous decline in slaughter weights of cattle and hogs and a sharp falloff in dairy production. These developments suggest that although the Soviets have been able to pretty well maintain livestock inventories, the tight feed situation is showing up in a loss of animal productivity in most sectors.

USSR WHEAT PRODUCTION and IMPORTS

YEAR	PRODUCTION	IMPORTS
(July/June)	(Million Metric Tons)	
1972/73	86	15.6
1973/74	110	4.5
1974/75	84	2.5
1975/76	66	10.1

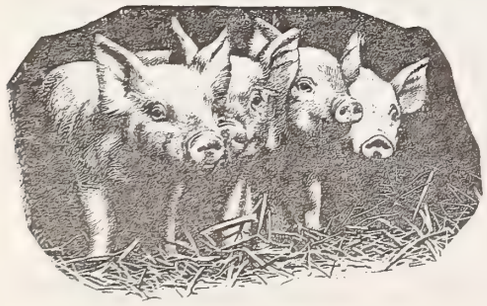
1978/79	121	5.1
1979/80	90	12.0
1980/81	98	16.0
1981/82	88	19.5
Projected 1982/83	80	19.0



HOGS

IMPROVED RETURNS , BUT NO SIGNS OF EXPANSION

Combined with lower feed costs, the improved prices created the most profitable situation for hog producers since mid-1979. The decline in pork production, along with smaller supplies of competing meats, during the first half of 1982 resulted in substantially higher hog prices. Production costs declined from a year earlier.

Despite the vastly improved costs/return situation, recent slaughter data would suggest that producers have not begun retaining a significant number of gilts for increasing the breeding herd, as would be the normal expectation. The generally unprofitable period of mid-1979 through 1981 has probably made producers cautious about expanding the herd. Other factors maybe poor financial conditions, high interest rates, and a need to generate internal capital to reduce debt loads and fund current operating expenses.

SECOND-QUARTER PORK PRODUCTION DROPS, PRICES RISE

Commercial pork production in the second quarter totaled 3,550 million pounds, down 9 percent from a year ago. The drop in pork production, coupled with smaller supplies of competing meats, contributed to a 29 percent year-over-year increase in hog prices. Barrow and gilt prices at the 7 major markets averaged $56.46 per cwt in the second quarter.

SECOND-HALF OUTPUT TO DECLINE

Third-quarter slaughter is largely drawn from hogs weighing 60 to 179 pounds on June 1. This category was down 10 percent. In July, federally inspected daily slaughter was down about 6 percent from a year earlier. Slaughter during the remainder of the quarter is expected to decline sharply and, for the quarter, average 12 percent below last year. Gilt retention may increase in late August and September, if a good corn crop becomes more certain. Commercial pork production for the third quarter is projected at 3,225 million pounds, down 11 percent from last year, because the average dressed weight is expected to increase from last year's relatively light 169 pounds.

Fourth-quarter slaughter will be largely drawn from the June 1 inventory of hogs weighing under 60 pounds, which was down 18 percent from a year ago. Last year, producers were reducing the breeding herd in the fourth quarter. In contrast, producers may be rebuilding the breeding herd this year, further diminishing the number of hogs available for market. Thus, commercial slaughter may be down more than that indicated by the 18 percent decline in the inventory. This fall, hog slaughter is forecast to drop 19 to 21 percent from last year.

MONTANA FARM NUMBERS UP SLIGHTLY

Based on survey data collected in June 1982, the number of farms and ranches in Montana is up 100 from 1981. However, land in farms and ranches remains stable at 62.1 million acres.

Since 1976, there has been a slow increase in units that meet the definition of a farm--that is units from which $1,000 or more of agiruclltural products were sold or would be sold during the year.

For the Nation, both number of farms and land in farms decreased slightly.

HIGHLIGHTS:

Record Wheat Crop Expected
Pastures & Ranges Good
Farm Prices Lower
Wheat Production Trends

U.S. WHEAT PRODUCTION NEARS RECORD

The U.S. all wheat crop is projected at 2.8 billion bushels, 1 percent below last year's record production. Indicated record Hard Red Win- production and an expected record Hard Red Spring crop will result in a record output of hard bread wheats. Poor weather reduced production prospects for Soft Red Winter wheat. The 1982 durum harvest will be down 22 percent because of a sharp decline in planted acres.

A near-record crop, combined with the largest carryover in 4 years may push 1982/83 supplies to a new high. Even though this year's disappearance is expected to match last year's record level, stocks next June are expected to rise over 1 billion bushels.

MONTANA CROPS AT RECORD LEVELS

Montana farmers are expected to produce a bumper wheat crop--3 percent above last year's record crop, but harvested from 7 percent fewer acres.

Barley production is also headed for a new record--13 percent above the previous high set in 1969.

The third major Montana crop to set a new high is hay--up 5 percent from last year's record.

August 1 production forecasts are based on producer reports of condition and yield. Actual field observations and measurements are also used in making the wheat production forecast. Production changes from 1981 are:

*Winter Wheat	--	down 9%
*Hard Spring Wheat	--	up 19%
*Durum	--	down 8%
*Barley	--	up 35%
*Oats	--	up 55%
*All Hay	--	up 5%
*Sugarbeets	--	down 9%
*Corn for Grain	--	unchanged
*Dry Beans	--	down 32%

Winter wheat, hard spring wheat, barley and hay yields are at new record highs.

ALL WHEAT--

MONTANA PRODUCTION TREND HIGHLIGHTS 1970-82

* **Acres Harvested--** Except for the 1977-80 period, which was mostly static, acres for harvest are trending upward. Farm programs, of course, have a direct impact. Wheat remains the most profitable crop on most of Montana's cropland acreage.

* **Yield--** For the last 13 years, no clear cut pattern appears to be emerging. There were 8 years when the yield was below the average of the period. Weather, no doubt, is the limiting factor.

* **Production--** Since 1974 production has been on a new level. The 1977-80 period again saw little progress, mainly because of lower yields and static acreage.

SPRING WHEAT--

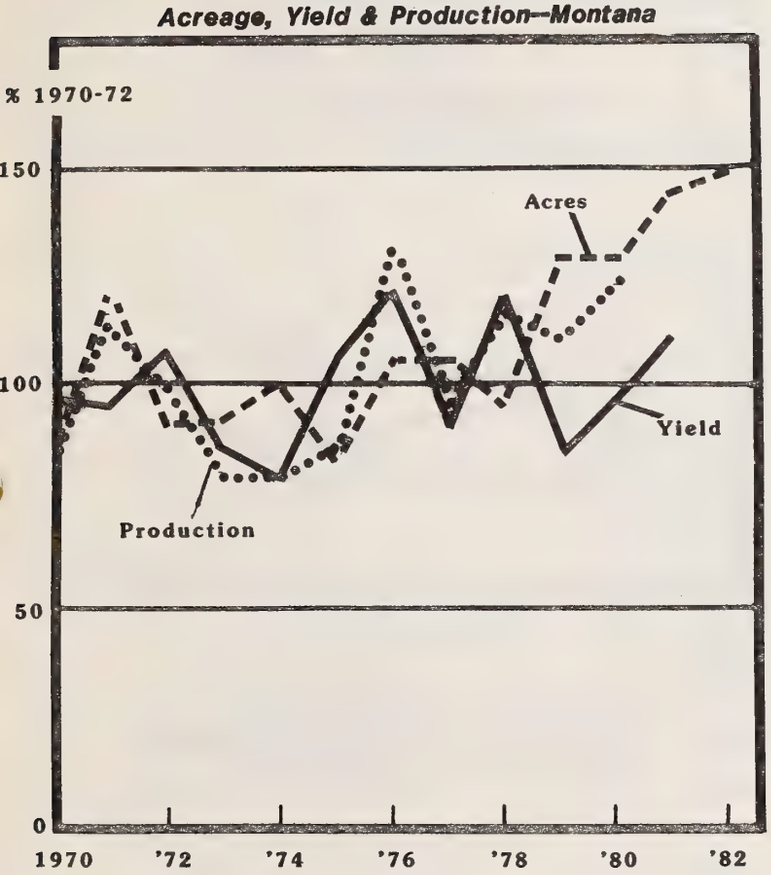
MONTANA PRODUCTION TREND HIGHLIGHTS 1970-82

* **Acres Harvested--** From 1970-77 acres were mostly static. Since 1978, acreage has been climbing significantly--partly because of less winter wheat.

* **Yield--** No visable trend apparent. Yield is highly variable depending mainly upon rainfall. The large influx of marginal acres could be offsetting the varietal improvements.

* **Production--** Closely follows the pattern of harvested acres.

SPRING WHEAT:
Acreage, Yield & Production--Montana



WINTER WHEAT--

MONTANA PRODUCTION TREND HIGHLIGHTS 1970-82

* **Acres Harvested--** Except for 1981, the trend has been mostly down since 1977. There were some rapid increases during the 1974-76 period.

* **Yield--** Highly variable but no visible trend apparent. Here again, the large increase of plowed up rangeland seeded to wheat could be affecting yields.

* **Production--** Influenced in most years mainly by harvested acres.

PASTURES & RANGES CONTINUE GOOD

Pastures and ranges continue to benefit from generally above average soil moisture supplies. They are in excellent condition for this time of year. The reported condition of 99 for August 1 is 22 points above the 10 year average.

MONTANA WHEAT VARIETIES - 1982

Winalta nudged Centurk to become Montana's number one winter wheat variety for 1982. Cheyenne went to second place and Centurk fell to third.

Olaf remains the favorite hard spring wheat variety. Newana moved from third to second place and Fortuna went from fourth to third.

Ward remains the top durum variety followed by Crosby and Cando, in that order.

BARLEY VARIETIES - 1982

Hector replaced Prioline this year as the leading Montana barley variety. The 1982 survey had Piroline in second place and Klages in third. Hector is a feed type variety while both Piroline and Klages are malting types.

Feed type varieties accounted for 52 percent of the total plantings in 1982--up slightly from last year.

FARM PRODUCTION EXPENDITURES FOR 1981

Farm production expenditures totaled $138.5 billion in 1981, 1.5 percent above the $136.4 billion in 1980. Interest paid on the farm debt was 24 percent higher in 1981. Expenditures for agricultural chemicals increased 18 percent while fuel and energy expenses rose almost 10 percent. For the second consecutive year, farmers and ranchers reduced their expenditures for livestock and poultry. The average total expenditure per farm during 1981 was $56,959 compared with $56,072 in 1980.

Farm services at $21.1 billion was the largest expenditure group and accounted for 15 percent of the total. Feed purchases at $19.0 billion represented 14 percent of the total; seeds, plants, fertilizer and agricultural chemicals $17.7 billion - 13 percent; interest and taxes $15.8 billion - 11 percent; livestock and poultry, $15.4 billion - 11 percent. Motor vehicles and farm machinery accounted for $13.5 billion or 10 percent of the total expenditure. Fuel and energy expenditures were $10.9 billion - 8 percent of the total.

LIVESTOCK SLAUGHTER APRIL-JUNE

Commercial red meat production for the United States during April-June 1982 totaled 9.10 billion pounds, down 4 percent from the April-June 1981 quarter. January-June red meat production, at 18.4 billion pounds declined 4 percent from the corresponding period last year. The 1982 accumulated production percent changes from last year by individual components were: Beef, down 2; veal, up 5; pork, down 9; lamb and mutton, up 9. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

Montana's slaughter plants produced 23 million pounds of red meat during the April-June period, 45 percent less than the same period last year.

April-June cattle slaughter at 10,700 head was 68 percent less than a year ago. Hog slaughter at 98,900 head was down 24 percent.

MEAT SUPPLIES TO CONTINUE DOWN

Total red meat and poultry production during the first half of 1982 was 3 percent below year earlier levels in the second half of the year. Total meat production will continue well below a year ago as further declines in pork production more than offset market gains in beef and broiler output.

CATTLE ON FEED INCREASING

Feedlots in the 13 major cattle feeding states held 8.98 million head on July 1, 1982, 4 percent more than the same date in 1980 and 1981. Steers made up 63 percent of the cattle on feed inventory.

Placements of cattle on feed during the April-June quarter totaled 5.77 million--up 3 percent from last year. Marketings are expected to be 5.71 million head during the July-September quarter of 1982--up 5 percent.

MILK PRODUCTION UP SLIGHTLY

The Nation's milk cows produced 35.5 billion pounds of milk during the April-June 1982 quarter, up 1 percent from last year. During the first half of the year milk production totaled 68.5 billion pounds, also up 1 percent from the same period in 1981.

In Montana, milk production increased 1 percent to 86 million pounds while cow numbers dropped 1,000 to 28,000 head.

HIGHLIGHTS:

Ag. Prices
Outlook on Exports
Crop Production
July Pasture & Range

PASTURE & RANGE GOOD

Rain continued throughout Montana during June resulting in good to excellent pasture and range conditions as of July 1. Cool weather has slowed plant development somewhat, but generally good moisture supplies are providing excellent grazing in almost all areas.

EXPORT HIGHLIGHTS

**Over the past few weeks, export market opportunities for U.S. grain and feed commodities have arisen in several markets. For wheat, opportunities have appeared in Yugoslavia and possibly other countries in Eastern Europe, which have been experiencing dry weather, and in Finland, where the government is committed to building large stocks. Additional Soviet purchases of U.S. corn could occur in the near term, following recent sales by Argentina that were smaller than expected. Possible new export markets have also appeared in Turkey and Indonesia for corn; and in Syria, Portugal and Peru for rice.

**Competition facing U.S. grain and feed exports has continued to increase. The European Community, in particular, has recently announced a special export rebate for wheat sold to China and has also sold Brazil wheat under 3-year credit terms. The Canadian Wheat Board has reportedly taken steps which would increase that country's grain shipments to the USSR in the coming year by as much as 2 million tons.

**The outlook for U.S. grain and feed commodity exports in fiscal year (FY) 1983 remains unchanged from a month ago, with total earnings expected to show a modest increase over this year's level, based mainly on prospects for both greater value and volume for U.S. corn exports.

**As of June 14, the official U.S. wheat export forecast (excluding products) for June-May 1982/83 was unchanged from a month ago at 44.6 million tons (1.64 billion bushels). Although this level is somewhat lower than 1981/82 exports of 47.4 million tons (excluding products), it would be the second largest volume ever.

MONTANA CROP PRODUCTION

The 1982 Montana winter wheat crop is expected to total 76.5 million bushels--14 percent less than last year. The July 1 forecast is 3 percent under the June 1 estimate based upon more recent survey data.

Montana's barley crop is expected to reach 73.6 million bushels--30 percent higher than 1981. Acres for harvest at 1.6 million are up 21 percent.

Oat production at 6.6 million bushels is up 36 percent. Acres for harvest at 150 thousand are also up 36 percent.

Sweet cherry production is forecast at 2,150 tons compared with 1,240 tons last year. Bloom was heavy, but winds decreased prospects somewhat.

Moisture supplies throughout Montana are adequate. The prevailing cool temperatures have been good for small grain growth and development.

The first production forecast for spring wheat, durum, corn, dry beans, sugarbeets and hay will be released on August 11.

FARM PRICES STEADY

Farm prices in Montana changed little from May to June. Most grain prices suffered while livestock prices increased moderately. Winter wheat, the largest volume grain in trade remained unchanged in price.

The Montana Index of Prices Received by Farmers for All Farm Products at 152 (1977=100) for June was unchanged from the May index. The crops index went down 1 point while the livestock and products index went up 2 points.

STATE HAIL INSURANCE PROGRAM

The Hail Insurance Unit of the Montana Department of Agriculture reported that so far this year 1,958 producers have taken hail insurance on their crops.

The total insurance inforce as of Friday, July 9th is $23,577,358.56. The levy for this is $2,032,435.47 which are new records for the Unit.

One hundred losses have been reported to date with some in the 100% loss range.

With a better than average crop across the entire state, Jack Gunderson, the Administrative Officer predicts that a record dollar coverage will also be reached of over $25,000,000.00.

With today's high production costs more producers feel the need for protection against hail losses.

Anyone interested in taking State Hail Insurance should contact their local County Assessor who write the policies or call the Hail Unit in Helena, 449-4762 for further information

Grain Stocks Up
Hog & Pig Numbers Drop
More Eggs Produced

WHEAT DISAPPEARANCE HIGH

For the 1981-82 marketing year which ended on May 31, Montana grain merchants moved 162.6 million bushels of wheat--37 percent more than the previous year. The yearly disappearance amounts to 94 percent of last year's record wheat production.

In spite of the high level of utilization of the 1981 crop, carryover stocks increased 14 percent and nearly equal one-half of last year's huge wheat crop.

Of the total stocks on hand, 86 percent is being stored on farms. Winter wheat stocks are up 24 percent, hard spring wheat stocks up 5 percent, and durum stocks up 57 percent from last year.

Of the total Montana wheat in storage, nearly 69 percent is in the government reserve or loan program. Nationally, 65 percent of all wheat stocks were under government control on June 1, 1982.

WORLD WHEAT MARKET

For the world wheat market, early prospects for 1982/83 indicate record global production, consumption, and trade--and higher ending stocks. The world stocks-to-use ratio is likely to exceed 21 percent--the highest since 1978/79--compared with less than 19 in 1981/82. The Soviet Union will probably account for the bulk of the world's increase in production and ending stocks.

Assuming continued large Soviet imports, world trade in 1982/83 could reach 100 million tons, slightly above this season's level. Total production by the major foreign exporters (Canada, Australia, Argentina, and the EC) is forecast to increase 2.4 million tons, with exports likely to rise about 4 million. Area, production, and exports will be larger for each, except for Canada, where production could be down.

Among the major importers, China is forecast to increase imports because of lower production due to poor weather. On the other hand, an import decline of 3 million tons is likely for the Soviet Union because of expected higher production. East European and Japanese imports will probably decline for the second consecutive year. Indian imports will likely continue, because of recent flooding and disappointing procurement levels. Other big markets will be Egypt, South Korea, and Bangladesh.

U.S. HOG INVENTORY DOWN

* The estimated U.S. inventory on June 1, 1982, at 52.0 million head is down 13 percent from last year and the lowest on June 1 since 1975.

* The breeding herd is down 12 percent. Estimates indicated 1.75 million gilts were added to the U.S. breeding herd during the December-May period--about 200 thousand more than in 1981. Sow slaughter during December-May included more of the December 1 breeding herd than any time since 1968.

* The U.S. market hog inventory was down 13 percent. The largest percentage decrease was in the under 60 pound weight group (18 percent). This indicates a larger share of the March-May pig crop has moved into the 60-119 pound group due to different farrowing patterns or faster weight gains.

* The U.S. pig crop at 41.0 million head reflects 13 percent fewer sows farrowed and 1 percent fewer pigs per litter. Litter size held up well despite severe winter weather in major hog states.

* The U.S. June-November intentions to farrow, at 90 percent of last year, indicates continued reductions in inventories.

ACREAGE REDUCTION UPDATE

Under the 1982 acreage reduction programs, only farmers who participate will be eligible for target-price protection (deficiency payments), Commodity Credit Corporation (CCC) loans, and the grain-reserve programs. Farmers who signed up at their local Agricultural Stabilization and Conservation Service (ASCS) office--between February 16 and April 16, 1982--have the option of changing their minds up until the final certification day, determined by each State for each crop. Certification deadlines have already passed for some commodities, mainly in the South and Southeast. In Montana, all crops must be certified by June 30. At the certification deadline, farmers must be in compliance with their permitted acreage to be eligible for program benefits. However, operators do not have to plant their full permitted acreage. By further reducing the area of the program crop, an operator can lower the acreage that must be devoted to a conservation use.

Final Enrollment Figures for 1982 Acreage-Reduction Programs

Commodity	Farms with bases			Acreage bases		
	Total number	Number enrolled	Percent enrolled	Total acres	Acres enrolled	Percent enrolled
				(1,000)	(1,000)	
Wheat	944,244	588,196	62.3	90,626	76,896	84.8
Corn	1,332,991	757,415	56.8	81,540	61,351	75.2
Sorghum	259,595	182,660	70.4	17,706	15,171	85.7
Barley	128,778	90,710	70.4	10,395	9,054	87.1
Oats	390,614	176,731	45.2	10,368	6,200	59.8
Rice	22,721	18,606	81.9	3,975	3,528	88.8
Upland cotton	138,149	111,907	81.0	15,308	14,115	92.2
U.S. total	3,217,092	1,926,225	59.9	229,882	186,315	81.0

Offsetting compliance and cross-compliance are not required under the 1982 acreage-reduction programs. Thus, farmers owning and operating more than one farm don't have to participate on all farms to qualify for program benefits on participating farms (offsetting compliance). And farmers need not comply with other acreage-reduction programs to be eligible for benefits on specific crops (cross-compliance). Further, normal crop acreages, national program acreages, allocation factors, and voluntary-reduction provisions do not apply when acreage-reduction programs are in effect.

EGG PRODUCTION INCREASES

Montana's laying flocks produced 45 million eggs between March 1 and May 31, 1982. The average number of layers was 750,000 during the quarter. Compared with a year earlier, egg production increased 7 percent while layer numbers decreased 3 percent.

The Nation's laying flocks produced 17,407 million eggs during the same period--down 1 percent from a year ago. The number of layers averaged 282,608--down 1 percent.

MONTANA'S WINTER WHEAT IMPROVES

Montana's 1982 winter wheat crop, now forecast at 79.1 million bushels, is 11 percent below last year's near record, but 6 percent above the May 1 estimate. Based on June 1 conditions, expected yield at 35 bushels per acre is the same as last year. Acres for harvest are down 11 percent.

Nationally, winter wheat production for 1982 is up 2 percent from the previous record high production set last year. For the 7 plains states, stretching from Montana to Texas, production is up 20 percent. The 3 Pacific Northwest states show a 17 percent decline while the 5 Corn Belt states are down 26 percent. However, in the 9 Southern states production is expected to be up 1 percent. The Southern states now account for 13 percent of the Nation's total winter wheat production--mostly soft red. In 1980 those states had only 7 percent of the total.

The increased production in the South is mainly due to dryer conditions since 1977 that have discouraged dryland corn production and increased soybeans. Wheat can be double-cropped with soybeans, and newer varieties of soft red offer higher yield potential.

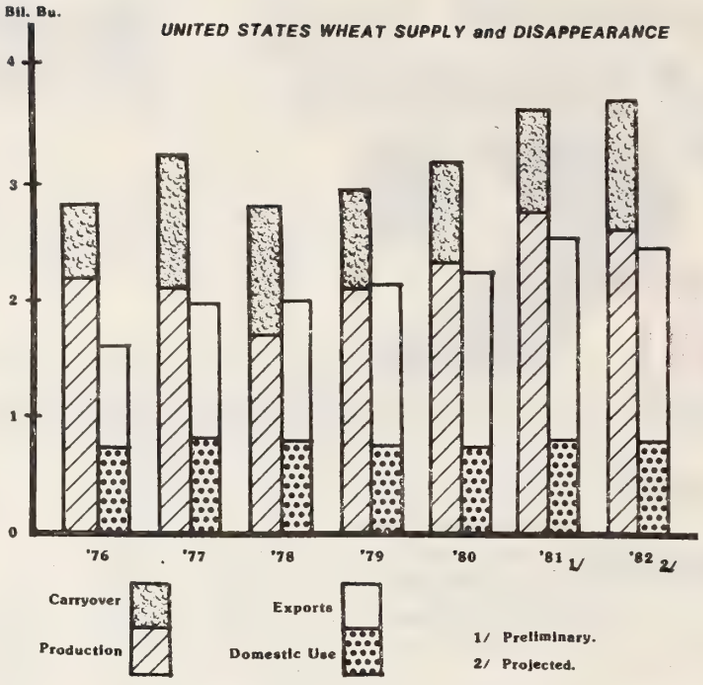
1/ These district estimates of winter wheat production are made possible through funds provided by the Montana Wheat Research & Marketing Committee.

WHEAT SURPLUS BUILDING

* Except for a slight projected dip this year, utilization of wheat has been increasing--mainly due to larger exports. Increases in domestic use are usually tied to animal feed.
* Production also has been rising and remains at a high level for this year.
* Production has been in relatively close balance with use.
* The slight imbalance between production and supply is gradually increasing the size of the carryover.



PASTURE & RANGE CONDITION

Pasture and range conditions were good to excellent throughout Montana as of June 1, 1982. Rain and snowstorms were spread over the entire State during the month of May. The eastern portion of the State has had a particularly wet spring and is now reporting excellent pasture and range conditions.

DAIRY AND POULTRY RECEIPTS UP

The 1981 cash receipts for Montana dairymen were up 10 percent from the previous year. Cow numbers were the same for the two years, but a greater production per cow and higher milk prices increased the receipts.

Cash receipts from chicken and eggs during 1981 were up 12 percent from a year earlier. The increase was the result of a 4 percent boost in layer numbers plus a large increase in the number of chickens sold.

FARM PRICES CHANGE LITTLE

Farm prices in Montana were higher for livestock, but lower for most crop items in May compared with April. Beef cattle, sheep, hogs, durum and barley all had price gains during the month; but winter wheat, hard spring wheat, milk, eggs and wool all registered price declines.

The May index of prices received for all farm products at 152 (1977=100) was up two points from April. The all crops index dropped 2 points while the livestock and products index went up 6 points.

CATTLE OUTLOOK

Declining total meat supplies, feedlots that are keeping current with their marketings, positive feeding margins, and good moisture conditions are a vast improvement over last year. Slaughter weights are well below last year's averages, and nonfed slaughter is declining.

FEEDER CATTLE SUPPLY DECLINES

The increased movement of stocker and feeder cattle this winter was in sharp contrast to a year earlier. In 1981, overweight cattle and depressed prices resulted in reduced feedlot placements. Although forage conditions a year ago were much less favorable than this past winter, very mild weather and adequate hay stocks allowed producers in 1981 to carry many of their cattle into spring in hopes of higher prices. Much of this year's stocker-feeder cattle movement during the first half probably has already occurred. Most of last year's first-half movement did not occur until after the drought extended into spring.

MONTANA CROP PROGRESS REPORT

Winter wheat is in fair to good condition, growing slowly, but benefiting from rain in most regions. Less than 5 percent is in the boot stage compared with 25 percent normally in the boot at this date. There are some reports of reseeding due to winter or spring injury.

Spring crops that have been seeded are emerging with adequate soil moisture. Cool, wet conditions in the major spring wheat areas have retarded emergence and growth but promise the crops a good start. Seeding is still lagging behind normal.

1/ These estimates of farmland values are based on benchmarks obtained from the 1978 Census of Agriculture. Extrapolations have been made using the indexes in Table 1. R=Revised.

FARMLAND VALUES DECLINED LAST YEAR

U.S. farmland values fell an average of 1 percent from February 1, 1981 to April 1, 1982. This decline follows increases in farmland values of 16 percent in 1979 and 9 percent in 1980.

Last year, Ohio sustained the largest decline, 15 percent, followed by Indiana with 13 percent, Delaware 10 percent, Illinois 9 percent, and Pennsylvania and Georgia, both with 8-percent decreases. The largest increases occurred in Texas, up 17 percent, and California and West Virginia, both up 10 percent.

While average U.S. farmland values slipped 1 percent, the consumer Price Index gained about 8 percent, causing the real value of U.S. farmland to drop by roughly 9 percent. After rising an average 6 percent a year during the 1970's, real farmland values dropped 2 percent in 1980, as an 11-percent gain in the Consumer Price Index offset the 9-percent rise in the price of farmland.

Since February 1980, the real value of farmland in the Corn Belt has declined an average of about 19 percent, compared with a 5-percent decline for the rest of the United States.

MONTANA WHEAT GROWERS

FACE TOUGH COMPETITION

Montana farmers are competing with both other U.S. production regions and foreign exporting countries for the sale of their wheat. The soft red wheat (SRW) states (mainly the east and south) have increased their production and sales the most in recent years. Huge amounts of SRW are exported to China with significant amounts going to eastern Europe, Portugal and Egypt. Soft red wheat is produced in states closer to gulf ports making it more attractive, price wise, to foreign buyers.

Ironically, farm prices for SRW, until this year, were nearly the same or even higher than the better quality hard winter wheat. Producers in the SRW states have access to cheaper barge transportation --the main reason for lower export prices for this class

For 1982, hard red winter is expected to be down 2 percent from 1981, SRW is forecast at 10 percent less, and white wheat will be down 15 percent. No forecast have been made for Spring wheat.

ACTUAL WHEAT COUNTS TO BE TAKEN

Wheat production forecasts are watched throughout the summer with great interest. Several sources of information are used to arrive at a Montana and U.S. production estimate each month during the growing season. In addition to individual farmer reports, an objective yield survey is done each month. In Montana 220 randomly selected fields of winter wheat, spring wheat and durum are sampled on farms across the state with the permission of farmers. Trained enumerators lay out 2 plots in each field. Each month the enumerators make various measurements, count wheat plants, determine maturity and harvest a portion of the heads for weighing. The information for all plots is combined and expanded to make an estimate of potential yield for the state, region and U.S.

Seventeen other states participate in similar Wheat Objective Yield surveys. By combining producer reports and Objective Yield data, more reliable production forecasts can be made, which help remove speculation about the crop.

HOW CROP ESTIMATES ARE MADE

Crop estimates start with basic data collected from farmers. However, it's not a simple process. Sampling lists are needed that are costly to build and maintain. The lists need to be as complete as possible with control data present that allows each list name to be classified for sampling purposes. Control data consists of acres operated and numbers of livestock. In Montana, there are about 20,000 farm operators used in selecting samples.

Next, an adequate number of responses need to be obtained for the survey results to be accurate. Cooperation is on a voluntary basis, therefore farmers must understand the need for survey results or they won't respond. Crop estimates mostly relate to the marketing side of farming--perhaps the least understood side of the operation.

After the data is collected, it is put through a sophisticated computer edit before it is summarized. The computer edits allow statisticians to review the data in a systematic way in order to detect weaknesses or errors.

The summarized data is then used to generate indications of acreage, yield, or production. Statisticians prepare state recommendations which are submitted to the Crop Reporting Board in Washington DC. The individual state estimates or forecasts are reviewed and compiled into a national total.

Finally, the estimates need to be released to the consuming public in a timely and effective way. In Montana, the use of press releases, radio broadcasts, and the Montana Crop and Livestock Reporter are the principal ways of disseminating the reports.

Reporters or others that provide voluntary information about Montana Agriculture receive releases free of charge.

CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed May 1 for slaughter market in the 7 states preparing monthly estimates totaled 7.07 million head, up 1 percent from a year ago and 3 percent more than May 1, 1980. MARKETINGS of fed cattle during April totaled 1.41 million, a 2 percent increase from last year but 1 percent less than April two years ago. PLACEMENTS of cattle and calves on feed in the 7 states during April totaled 1.57 million, down 9 percent from the record high April 1981 placements though 27 percent more than the relatively low level of 1.24 million during April 1980. NET PLACEMENTS of 1.46 million for April are off 8 percent from last year but 32 percent greater than 1980. OTHER DISAPPEARANCE totaled 190 thousand compared with 142 thousand during April 1981 and 130 thousand two years ago.

MAY 1 POTATO STOCKS DOWN

MONTANA PRODUCERS had 30,000 cwt in storage on May 1, 1982--down 40 percent from the 50,000 cwt on hand May 1, 1981.

NATIONALLY there were 46.1 million cwt in storage May 1, 1982. This is 4 percent above May 1 a year ago, but 23 percent less than on May 1, 1980.

HAY STOCKS

Hay stocks on Montana farms and ranches on May 1 at 865,000 tons were 6 percent below 1981 on the same date. The May 1 stocks is considered to be carryover into the next feeding season and represents 18 percent of 1981's production.

Lower carryover stocks from last year are a result of an 8 percent increase in the cattle inventory and a much harsher and longer winter feeding season.

WHEAT PRODUCTION FORECAST

Montana's winter wheat crop is forecast at 74.6 million bushels--16 percent below 1981. The forecast is based upon farmers reported condition of the crop on May 1. Acres for harvest are down 11 percent and expected yield is 2 bushels under last year.

The spring wheat acreage estimate will be released on June 29. The first forecast of spring wheat production (including durum) will be released on August 11.

Last year Montana produced 172.8 million bushels of all wheat. This year's production will depend upon farm program participation as well as unpredictable weather factors.

PASTURE & RANGE CONDITION GOOD TO EXCELLENT

Montana's pastures and ranges are in much better condition this May 1 than last year. However, more moisture and warmer days will be needed for growth to reach optimum levels. The abnormally cool weather of April and early May is slowing growing and preventing drought stress where topsoil moisture is lacking.

TRACTOR SHIPMENTS DOWN AGAIN

Tractor shipments from manufactures has decreased for the third straight year. The total wheel-type tractors shipped during 1981 at 141,445 was down 3 percent from 1980, 30 percent from 1979 and 18 percent from 1978. Shipments for the month of January 1982 are down 38 percent from January 1981. Tractor shipment data is supplied by the Bureau of the Census.

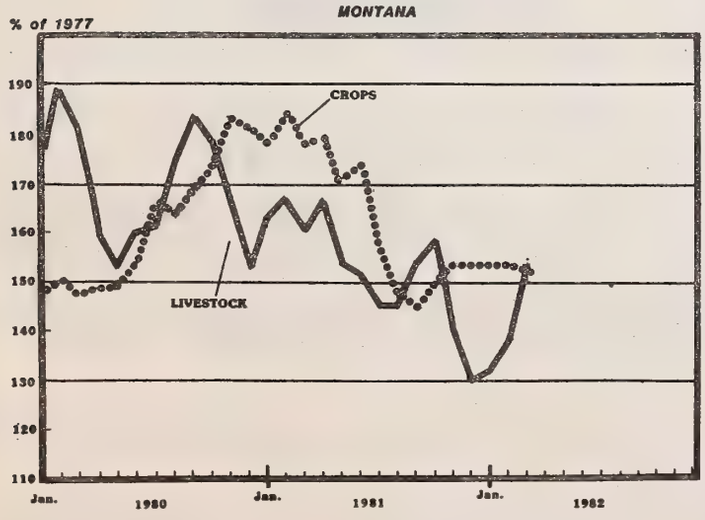
MONTANA

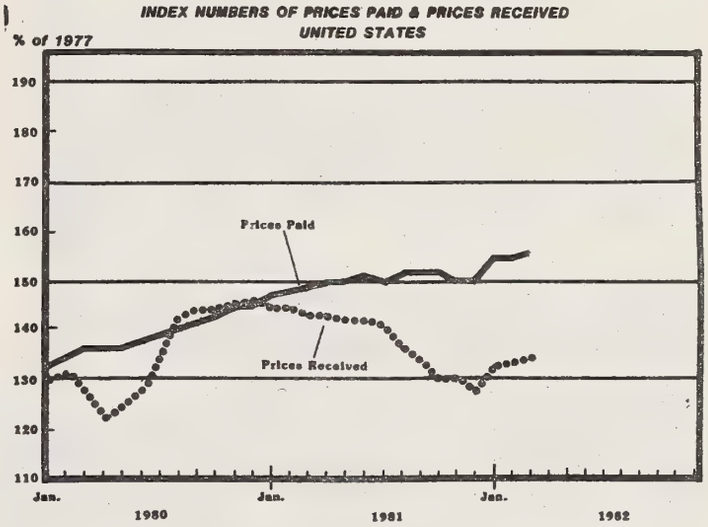


FARM PRICES SHOW LITTLE CHANGE

Mid-April farm prices in Montana were about the same as the March monthly average. Although slight price increases were noted for hard spring wheat, barley, alfalfa hay, beef cows, calves and hogs, price decreases were seen for winter wheat, durum, oats, steers & heifers, sheep, lambs, milk and eggs.

INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED

UNITED STATES



MONTANA DAIRY PRODUCTS

Montana dairy plants produced 493,000 pounds of creamed cottage cheese during March 1982--up 13 percent from February and up less than 1 percent from March 1981. Ice cream frozen at 163,000 gallons was 9 percent below last year. Butter made at 223,000 pounds up 20 percent from a year ago.

QUESTIONS FARMERS ASK ABOUT CROP & LIVESTOCK REPORTS . . .

DO FARMERS SEND IN FALSE REPORTS?

Very few. Usually, if a reporter takes the time to fill out a report, it's reasonably accurate. False, or non-representative reports are also detected by use of sophisticated computer edits. Besides, what purpose would be served by an inaccurate report? Most buyers already have a good idea of supply through their own surveys or other information sources.

Farmers who under-report production could falsely signal other farmers to increase production. Also, their yields would be too low. Others who report too high could provide a reason for buyers to reduce prices.

Our record, when all final production and marketing data have been tabulated, supports the accuracy of our farm reporters. Most farmers report honestly and should continue to do so because false reports result in unpredictable and perhaps negative results.

MONTANA GRAIN BINS STILL HOLD NEAR RECORD WHEAT STOCKS

Wheat stocks in Montana on April 1, 1982 were the second largest holdings on record, exceeded only by stocks on April 1, 1978. The bulk of the stocks (86 percent) is in farm storages.

The 26 percent increase in wheat stocks over last year is mainly the result of the huge 1981 crop. Carryover stocks into the current marketing year were the largest since 1975.

Movement from storage positions during the January 1 - April 1 quarter was brisk, exceeded only slightly by the record Jan.-Apr. disappearance set in 1981. However, as a percent of total supply the movement is down from the last two years, indicating carryover stocks will be larger than last year.

Wheat placed in government storage and loan programs is running ahead of last year. As of March 31, 1982 76 percent more wheat was in the loan program and 34 percent more was in the reserve compared with a year ago.

Of the total wheat in storage, about 52 percent is winter wheat, 40 percent is hard spring and 8 percent is durum.

(See tables page 2.)

FARM and RANCH PROSPECTS -- 1982

The Nation's huge farm production machine is starting to roll. Although 1982's prospects are still uncertain, favorable moisture is setting the stage for large harvests. Acreage-reduction programs could affect final output. So could unfavorable weather if it develops. Still, modern farm technology offers considerable immunity to disaster, and intensive management on the best acres will help maintain high production levels in spite of planting curbs. No doubt about it--U.S. farmers are masters of production.

Market prospects are much more uncertain. Last year's crops continue to sell at low prices. Much of what is in store for farm prices depends upon economic recovery and strong exports--both of which are outside of farmers direct influence.

LIVESTOCK

Total meat and poultry production will likely drop about 4 percent this year. Pork producers are cutting back sharply, beef production will stay about even, and poultry is expected to rise only 1 percent. This would mean a 5 percent drop in per capita meat consumption. Still, strong economic recovery will be needed to push market and retail prices upward.

The United States imports considerable amounts of beef--mainly lower quality lean meat used for hamburger, bologna, etc.--and exports smaller quantities of high-value, high-quality meat--about 60 percent of which goes to Japan. However, U.S. exports have been growing and will likely reach 100,000 metric tons in 1982. Beef and veal imports were down to 799,000 metric tons in 1981, accounting for 8 percent of consumption, and are expected to decline again in 1982.

WHEAT

Winter wheat stands are good to excellent in most of the country and spring wheat planting conditions are favorable. The present winter wheat stand does generally exceed the established wheat acreage base and growers may be reluctant to pare the stand back. Spring wheat growers will likely view the acreage-reduction program more favorably. Further price deterioration would strengthen the incentive to participate.

On the world scene, wheat consumption is expected to drop below production for the first time since 1978/79. World stocks may exceed last year but still be below most years in the 1970s. World wheat trade is forecast to be a record 100 million tons in 1981/82--up 7 percent. U.S. exports are forecast to be up nearly 20 percent.

COARSE GRAINS

With the global economy still sluggish, total export use of U.S. feed grains will be down. Total domestic and export use is forecast to be only 1 percent above last year. As a result, ending stocks will likely reach 2.1 billion bushels, putting downward pressure on prices. The U.S. share of world trade could decline to 60 percent--its lowest level in nine years.

NATION'S LIVESTOCK SLAUGHTER DOWN

A smaller hog kill, together with lighter weights for both cattle and hogs, dropped total red meat production in the United States 3 percent this March compared with a year ago. The January-March total for 1982 is running 5 percent below last year. The cattle kill was up 2 percent but averaged 23 pounds per head lighter resulting in 1 percent less beef produced. The hog kill dropped 5 percent with a 2 pound per head average decline.

MONTANA HAS MORE POTATO STOCKS

Montana producers had 900,000 cwt. of potatoes in storage as of April 1, 1982--25 percent more than last year on this date. Disappearance from storage during March totaled 550,000 cwt., down 5 percent from the same period last year. Production in the state during 1981 at 1,739,000 cwt. was 1 percent more than a year ago.

Nationally, potato stocks as of April 1, 1982 in 15 major fall states are estimated at 77.5 million cwt. This is 7 percent above April 1 a year ago, but 16 percent less than on April 1, 1980.

QUESTIONS FARMERS ASK ABOUT CROP & LIVESTOCK REPORTS . . . .

Why is the government always prying into farmers' affairs?

In a highly commercialized agriculture, farm leaders--especially commodity group leaders--are striving for more and better statistics. These leaders recognize the necessity of statistics to keep both export and domestic market functions running smoothly. They also use statistics to formulate government farm policy and programs.

The collection and publication of these statistics is possible only through cooperative effort--farmer's in partnership with their government. Without this program, farmers could be the victims of private figures heavily biased towards self interest.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 436,000 pounds of creamed cottage cheese during February 1982--up 4 percent from January and up 9 percent from February 1981. Ice cream frozen at 109,000 gallons was 4 percent above last year. Butter made at 237,000 pounds was up 18 percent from a year ago.

MORE MILK PRODUCED

Montana dairymen produced 6 percent more milk during the January - March quarter than a year earlier, even though cow numbers held steady. The totals of 83 million pounds of milk from 29,000 cows were the same as the October - December quarter.

- U.S. & Montana Wool Situation
- March Farm Prices
- Lower Livestock Receipts
- More Eggs

U. S. SITUATION

Wool prices since mid-1981 have exhibited little movement reflecting the small volume of mill purchases. Mills have been very cautious and have been drawing on their inventories to meet their needs. Most of the wool consumed by mills in the latter part of 1981 was bought in the spring. High interest rates and more competitive prices of imported wool have depressed domestic sales. However, recent reports indicate that world wool prices have moved up as a result of renewed purchasing by Japan and Eastern European countries. Price rises have ranged from 5 to 8 cents.

Congress recently voted to extend the National Wool Act of 1954 to December 31, 1985. The provisions of the new legislation are the same as the previous law except that the incentive payments are based on 77.5 percent of the formula in the Act instead of 85 percent. Under this program, government payments to wool growers were an estimated $37.5 million in 1981, 12 percent above 1980.

MONTANA WOOL PRODUCTION INCREASES

Montana's 1981 wool production, up 6 percent from 1980, was the highest since 1974. The total value of the clip, at $5.8 million, was up 9 percent.

Montana ranks 7th in total production. Texas, in 1st place, equaled the combined production of California and Wyoming, the 2nd and 3rd ranking states. The 11 western states produced 53 percent of the nationaltotal; Texas had 19 percent; the states west of the Mississippi nearly 90 percent.

LIVESTOCK RECEIPTS DOWN

Cash receipts received by Montana livestock producers for meat animals in 1981 were 18 percent less than 1980. The decrease was a result of 10 percent fewer cattle marketings and lower prices for both cattle and sheep. Last year's cash receipts were down 25 percent from the record set in 1979.

MARCH SUMMARY

CROPS: Winter wheat was in fair to good condition during March. Snowcover was generally adequate to protect the crop from both wind damage and cold temperatures most of the month. Some areas were melted off but recovered again prior to the arrival of severe temperatures and wind.

Frequent snow mixed with rain showers added to soil moisture supplies over most of the state. The wet, cool weather prevented field tillage work.

LIVESTOCK: Calving and lambing were often difficult because of wet ground and chilling wind. But sunshine and some warming during the daylight hours allowed good survival.

Feed supplies are adequate for the remainder of the feeding season and livestock are in good condition.

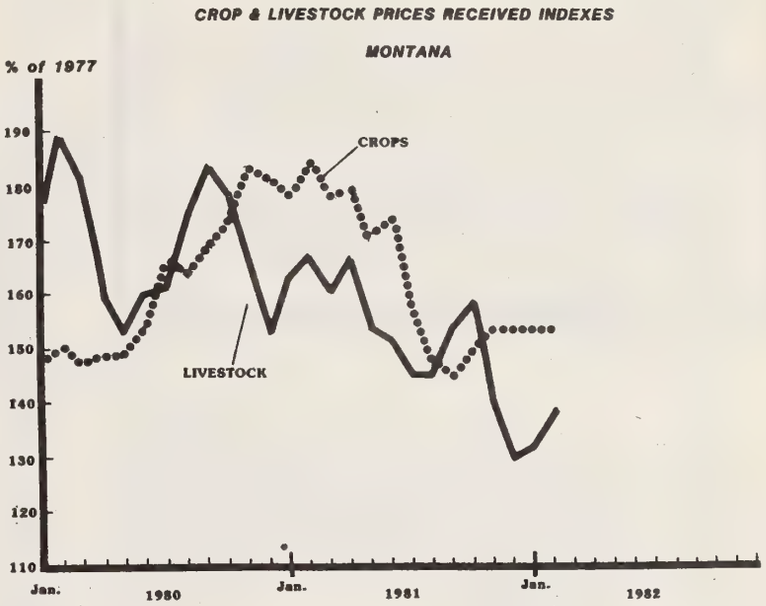
FARM PRICES SHOW LITTLE CHANGE

Higher prices for cattle--lower prices for crops highlighted Montana's farm price situation in March compared with a month earlier. However, the state's farmers and ranchers were still receiving lower prices than a year ago for all items except hogs, lambs and eggs.

Wheat and barley prices started to sag at the start of last year's harvest and have never recovered. Beef cattle prices have been fairly soft, except for brief periods, since the fall of 1979.



MONTANA PASTURE & RANGE

Montana's pastures and ranges were in good to excellent condition as of April 1, 1982, except for the eastern third of the State. Most of the eastern portion of Montana was rated in fair condition but the northeastern corner of the State was still reporting very poor pasture and range conditions.

QUESTIONS FARMERS ASK ABOUT CROP & LIVESTOCK REPORTS . . . .

Why do I always get picked to answer these questionnaires?

First, we have to obtain the basic data from farmers and ranchers to compile state and national totals. However, not all producers receive questionnaires. A random sample is designed to represent everyone who has the item of interest being estimated. Only those selected in the sample are mailed a questionnaire. To obtain the best accuracy at the least cost, the larger operations are sampled more heavily. They account for a larger portion of the population being sampled.

Next, we need to have an adequate return to insure accurate results. That's the reason many producers who don't respond by mail are called by telephone.

Within the bounds of proper survey methods we do try to rotate selection of farmers and ranchers as much as possible to reduce 'respondent burden'.

EGG PRODUCTION INCREASES

Montana's laying flocks produced 48 million eggs between December 1, 1981 and February 28, 1982. The average number of layers was 770,000 during the quarter. Compared with year earlier levels, egg production increased 12 percent while layer numbers stayed the same.

The Nation's laying flocks produced 17,394 million eggs during the same period--virtually unchanged from a year ago. The number of layers averaged 290,232, down almost 1 percent.

HIGHLIGHTS:

Cattle on Feed Numbers Down
Statistics Program Cut
More Potatoes in Storage
Hog Inventory Down
So Much Wheat!

AGRICULTURAL OUTLOOK -- 1982

--For 1982, low farm prices and commodity programs may reduce crop production. However, the level of decrease is still uncertain.

--Poor returns are limiting livestock production. In 1982, beef may keep steady with last year, pork will decline sharply, and poultry will likely grow only 2 percent (growth was 6 percent in 1981).

--Although prices paid by farmers are rising more slowly, expenses are still expected to climb faster than cash receipts--stifling net farm income for the third straight year. Inventory values may also decline putting further pressure on farm income.

--The value of exports are projected down 3 percent from fiscal 1981 despite a 4 percent increase in volume. Poor worldwide economic conditions and large supplies are to blame.

--Fertilizer and pesticide usage will decline and investment in machinery will remain limited.

POTATO STOCKS UP

Montana producers had 1.5 million cwt of potatoes in storage as of March 1, 1982--12 percent more than a year ago.

In the 15 major fall states there were 15.4 million cwt in storage on March 1, 1982. This is 11 percent above March 1, 1981, but 12 percent below March 1, 1980.

STATISTICS PROGRAM CHANGED

Reductions and changes in the crop and livestock estimating program of the Statistical Reporting Service were necessary to stay within Fiscal 1982 funding levels. Changes were made following an extensive review of the entire estimating program.

The following are changes having the most impact on Montana's agricultural statistics program:

--Elimination of the December Winter Wheat yield and production forecast for the following year in all states.

--Elimination of the July Durum and Other Spring Wheat production forecast for all states.

--Elimination of Alfalfa Seed acreage, yield and production forecasts for all states.

--Discontinue the annual Fertilizer Consumption report in all states.

--Reduce Quarterly Cattle on Feed from 23 states to 13 major states--Montana estimates are discontinued.

--Reduce July Cattle Inventory and Calf Crop to U.S. data only.

--Discontinue July Lamb Crop and Wool Production for all states.

--Eliminate Honey estimating program in all states.

--Eliminate Mink estimating program in all states.

--Livestock Slaughter and Manufactured Dairy Products now published monthly will be changed to quarterly in all states.

MONTANA DEPARTMENT OF AGRICULTURE

Show Off Your Ag IQ

How much do you know about agriculture? Test yourself and then others. Answers are on page 4. (Source: The 1981 Fact Book of U.S. Agriculture.)

1. How many farms are there in the United States?
   (a) 780,000 (b) 1.5 million (c) 2.4 million (d) 3.2 million

2. USDA defines a farm as a place where people live and sell agricultural products worth at least:
   (a) $50 (b) $250 (c) $750 (d) $1,000

3. The approximate size of the *average* U.S. farm is:
   (a) 200 acres (b) 320 acres (c) 400 acres (d) 430 acres

4. The majority (61 percent) of U.S. farms in 1980 sold agricultural products worth less than:
   (a) $20,000 (b) $40,000 (c) $60,000 (d) $100,000

5. What percentage of Americans' disposable income is spent on food today?
   (a) 16.6 (b) 17.6 (c) 18.1 (d) 19.8

6. Twenty years ago, farmers received 38 cents of every food dollar spent by consumers at the retail level. What is the farmers' share today?
   (a) 37 cents (b) 40 cents (c) 43 cents (d) 48 cents

7. The United States exports more farm products than any other country in the world. In 1981 U.S. farm exports totaled nearly:
   (a) $22 billion (b) $35 billion (c) $44 billion (d) $48 billion

8. Which country was the leading importer of U.S. agricultural products in fiscal 1980?
   (a) Mexico (b) China (c) West Germany (d) Japan

9. The United States was also among the world's six largest importers of agricultural products in 1980. Which country was the largest supplier to the United States?
   (a) Australia (b) Mexico (c) Colombia (d) Brazil

10. (Some people believe far too much U.S. farmland is foreign-owned.) What percentage of U.S. farmland is owned by foreigners?
    (a) less than 1 (b) 3 (c) 5 (d) 8

Answers on back page.

MARCH 1 HOG INVENTORY LOWER

The inventory of hogs and pigs on March 1, 1982 in the 14 states conducting quarterly hog surveys is estimated at 44.9 million head, 10 percent below last year and 18 percent less than March 1, 1980.

The breeding inventory, at 6.22 million head, is 14 percent less than a year ago and down 13 percent from two years earlier. The market hog inventory at 38.7 million head is 10 percent less than last year and 17 percent below March 1, 1980.

Estimates for the 14 quarterly states account for about 87 percent of the U.S. total hog and pig inventory.

The December 1981-February 1982 pig crop in the 14 states totaled 15.6 million, 11 percent fewer than 1981 and 21 percent less than 1980. There were 2.20 million sows that farrowed during December-February, a decrease of 10 percent from a year ago and a reduction of 20 percent from the same period two years ago. Sows farrowing averaged 7.11 pigs per litter compared with 7.23 a year earlier and 7.17 two years ago.

Hog producers in the 14 quarterly states intend to have 2.65 million sows farrow during the March-May 1982 period, 14 percent fewer than 1981 and 21 percent below two years ago.

Farrowing intentions reported for the June-August 1982 period are 2.41 million sows, 12 percent less than the same period a year ago and 15 percent below two years ago.

MORE FOOD FOR YOUR MONEY

Despite recent rises in food prices, family income buys considerably more food today than 30 years ago, partly because agriculture has become much more efficient and partly because consumer incomes have risen faster than food prices. For example, here's what the average U.S. factory worker could buy with an hour's pay in 1950 and in 1980:

Food Item	1950	1980
White bread	10.1 lbs.	14.3 lbs.
Frying chickens	2.5 lbs.	10.1 lbs.
Milk	8.0 qts.	13.8 qts.
Potatoes, fresh	32.7 lbs.	38.3 lbs.
Eggs	2.4 doz.	8.7 doz.
Pork	2.7 lbs.	5.2 lbs.

JANUARY-FEBRUARY LIVESTOCK SLAUGHTER 1981 & 1982

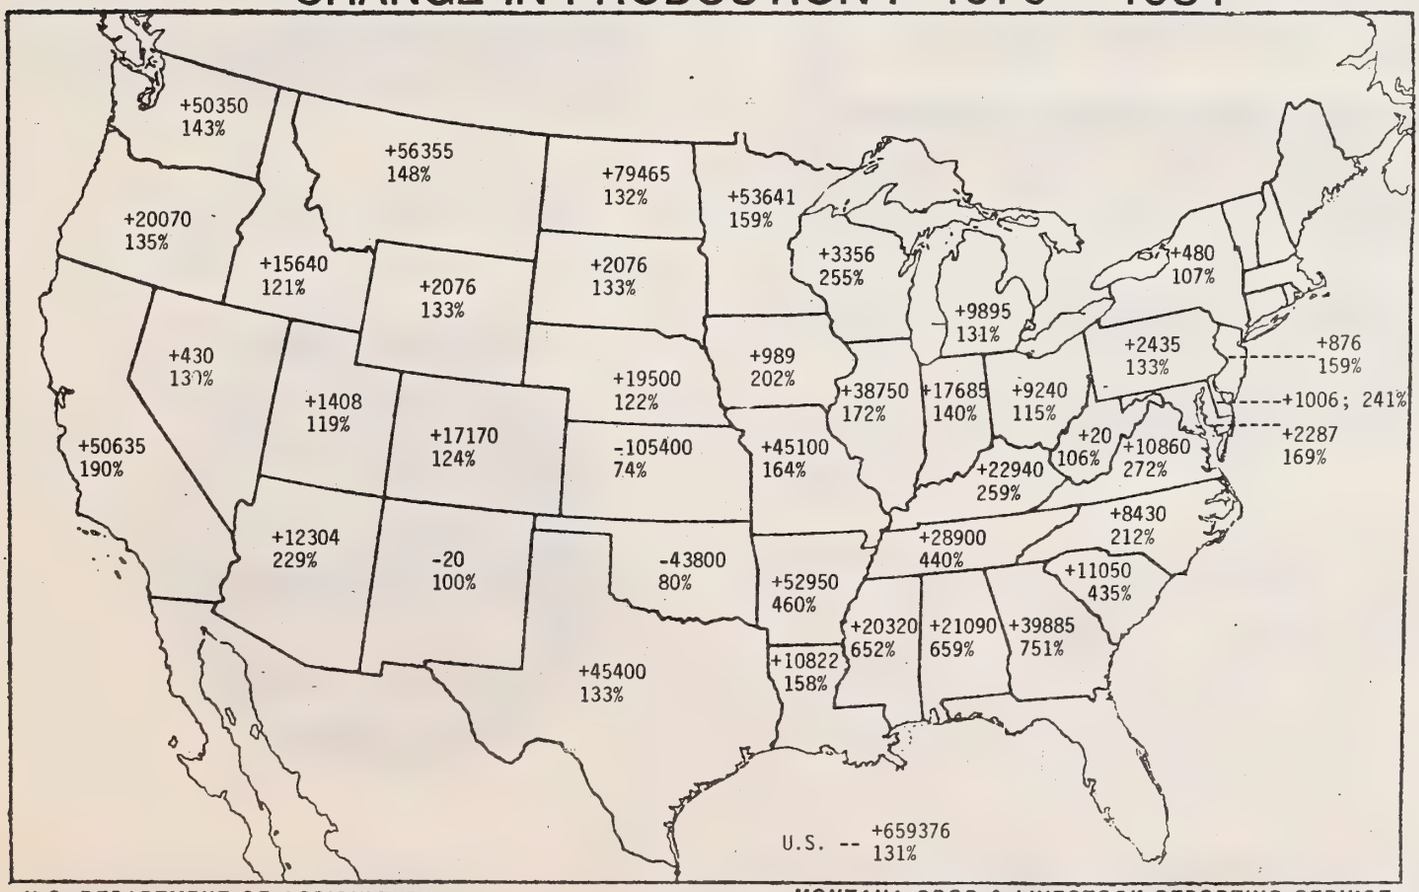
WHERE IS ALL THE WHEAT COMING FROM?

Last year's record all wheat crop pushed January U.S. stocks over the 2 billion bushel mark. Although exports are at record levels, supply continues to exceed demand keeping pressure on prices. The Montana all wheat February price averaged $3.71, down 75¢ from a year earlier.

Why is there so much wheat? Although production has increased in most states from 1979-1981, the biggest boom has been in the southeastern states. For example, in the past three years Georgia has increased wheat production a whopping 751 percent and Alabama and Mississippi are up over 600 percent! So, while the traditional wheat states have pushed up production, more rapid expansion is occurring in southern non-traditional states.

These states, however, are producing a different class of wheat. They produce a soft red winter variety while the Northern wheat belt, including Montana, produces hard red winter wheat. They harvest their wheat in May and June then may plant another crop such as grain sorghum or soybeans.

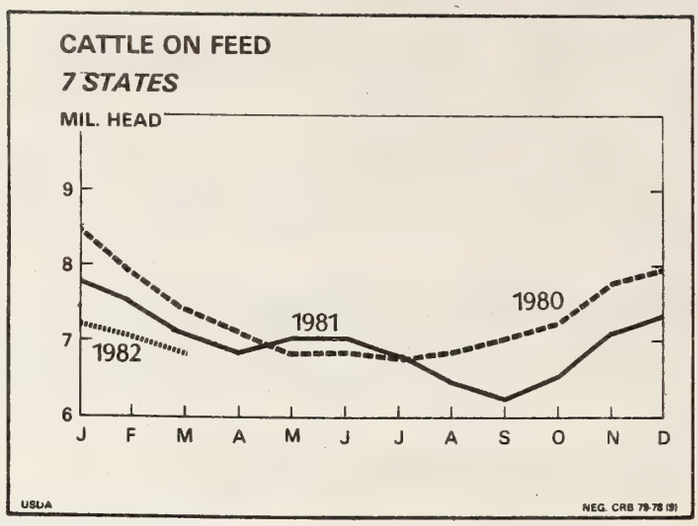
ALL WHEAT
CHANGE IN PRODUCTION : 1979 - 1981



CATTLE ON FEED IN 7 STATES OFF

Cattle and calves on feed March 1 for slaughter market in the 7 states preparing monthly estimates totaled 6.87 million head, down 4 percent from a year ago and 8 percent from March 1, 1980.

MARKETINGS of fed cattle during February totaled 1.41 million, down 2 percent from last year and 11 percent lower than February 1980. PLACEMENTS of cattle and calves on feed in the 7 states during February totaled 1.32 million, 11 percent more than last year and 8 percent greater than February 1980. NET PLACEMENTS of 1.23 million are up 16 percent from last year and 15 percent from February 1980. OTHER DISAPPEARANCE totaled 93 thousand compared with 129 thousand during February 1981 and 155 thousand two years ago.



QUESTIONS FARMERS ASK
ABOUT CROP & LIVESTOCK REPORTS . . .

If I return a filled out questionnaire on my crop and livestock production, isn't it just like telling how much money I have in the bank?

Not at all. The Crop and Livestock Reporting Service collects statistics on a voluntary basis from farmers and ranchers and holds individual reports in strict confidentiality. We've never betrayed our public trust. What farmers raise and store on their farms and ranches is their business. Our business is to provide accurate state and national totals. We need individual reports only to arrive at these totals. No one else, including other government agencies, ever sees individual questionnaires.

Answers to Ag IQ Quiz

1. (c) 2.4 million
2. (d) $1,000
3. (d) 430 acres
4. (a) $20,000
5. (a) 16.6 percent
6. (a) 37 cents
7. (c) $44 billion
8. (d) Japan
9. (d) Brazil
10. (a) less than 1

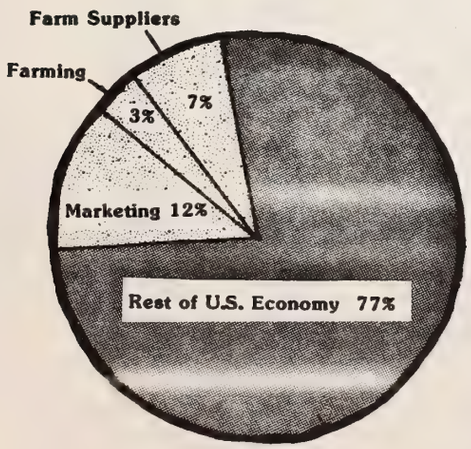
Ag Prices Up
Report on Grazing Fee Survey
Fertilizer Situation
'81 Crop Summary
Mfg. Dairy Products

EMPLOYMENT GENERATED THROUGH AGRICULTURE

Nearly 23 percent of the U.S. labor force is employed in farming, farm-product marketing, and farm-supply activities--about 24 million workers. Farm production will use about 3.3 million workers in 1982--around 3 percent of the national labor force and 14 percent of all workers required by the food and fiber system. Other employment generated by agriculture includes 2.5 million workers in farm resource and service activities, 7.7 million in transportation and retailing, 5.1 million in the manufacture of feeds and other farm products, 1.7 million in food processing, and 3.3 million in eating establishments.

Agricultural Sector: A Large National Employer



FARM PRICES IMPROVE SLIGHTLY

Higher livestock and barley prices helped boost the mid-February index of prices received for all farm products in Montana to 146 (1977=100)--up 3 points from mid-January. Tempering the increase were lower prices for wheat, oats, milk and wool.

(See tables page 2.)

GRAZING FEE SURVEY

A private grazing fee survey was conducted during November-December 1981 in five states having counties adjacent to National Grasslands. The survey purpose was to determine grazing fees paid on privately owned, non-irrigated grazing lands during 1981. Ranchers included in the survey were those in Richland, Dawson, Wibaux, Prairie, Custer, Powder River, Fallon and Carter counties.

The results of the survey will be compared with grazing rates currently in use on National Grass lands to evaluate fees charged by the Forest Service.

RATES PAID for LEASED PRIVATE GRAZING LAND -- 1981

STATE	NUMBER COUNTIES	DOLLARS PER ANIMAL UNIT MONTH

FERTILIZER OUTLOOK

Stable to slightly lower consumption and smaller price increases than in the recent past highlight the fertilizer outlook for spring. Although climbing costs of production, transportation and retailing will pressure the fertilizer industry to raise prices, large inventories, stable domestic use and lower than expected exports will likely slow any increases.

With nitrogen fertilizer use close to last year's levels, May 1982 prices could average 4 to 9 percent above a year earlier.

After an 8 percent decline during the fall of 1981, phosphate prices may return to last spring's level. However, for prices to rise, exports will have to resume a vigorous pace, and continued production cutbacks will have to offset high early-season inventories and stagnant demand.

Given expected prices, fertilizer should be readily available this spring.

QUESTIONS FARMERS ASK ABOUT CROP & LIVESTOCK REPORTS . . .

Wouldn't it be better if producers quit revealing their hand to traders and processors who already have more muscle in the marketplace ?

Sure, if farmers could collect and analyze enough data to make accurate estimates to be held 'tightly' among themselves for bargaining advantage.

BUT-- the trade will spend the time and money to assess supply in the absence of USDA reports. Fair prices depend upon all trading partners being equally informed. Crop and livestock reports fulfill that need.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 421,000 pounds of creamed cottage cheese during January, down 2 percent from a year ago. Ice cream production at 95,000 gallons was down 29 percent, while butter made at 266,000 pounds was up 19 percent.

LESS WHEAT - MORE BARLEY IN MONTANA

Based on a February 1 planting intentions survey, Montana farmers will plant 4 percent less spring grains (wheat, oats & barley) for harvest in 1982. For the nation as a whole, February 1 planting intentions for these grains will increase slightly. The Nation's corn acreage is also pointed up a small amount.

Unfortunately, farm program details were not announced until Janaury 29--almost a week after questionnaires were mailed to farmers. For this reason, the intentions report only reflects farmer's analysis of conditions prior to official program announcements.

LIVESTOCK SLAUGHTER DOWN

The sharply reduced hog kill, coupled with slightly lighter weights for both cattle and hogs, dropped total red meat production in the Nation 8 percent this January compared with a year ago. Red meat production in 1981 was almost identical to 1980. National slaughter levels in 1982 will likely reflect the 9 percent decreases for both hogs and cattle on feed numbers.

Montana slaughter levels appear to be following the National trend.

POTATO STOCKS UP

On February 1, 1982 Montana producers had 1.6 million cwt of potatoes in storage--1 percent more than a year ago.

There were 132.8 million cwt in storage on February 1, 1982 in the 15 major fall states. This is 9 percent above February 1, 1981. Of the total stocks on hand in the 11 major states reporting stocks by type, 74 percent were Russetts, 22 percent were Whites and 4 percent were Reds.

MEAT SUPPLIES DECLINE

Meat supplies are falling from recent record highs, and livestock prices are strengthening. Reduced feed prices and larger forage stocks, combined with rising livestock prices, are improving feeding margins. However, following losses since mid-1979, sustained profits will be necessary to encourage increased cattle feeding and hog production. While feed prices are expected to remain below last year's levels, feeding costs will likely rise seasonally. For continued improvement in feeding margins, higher livestock prices will be needed to offset any rise in feed costs. Meat supplies will be down in the second half of the year, and prices are expected to rise. The extent of the price increase will depend on the strength of economic recovery and improvement in consumer purchasing power.

WHEAT UTILIZATION

Montana wheat shipped to out-of-state destinations in the 1980 marketing year (June 1980 - May 1981) is estimated at 102.4 million bushels--9 percent less than the previous year. This movement to out-of-state destinations represented 86 percent of total disposition.

The amount headed for Pacific Northwest areas was 92.5 million bushels and represents 90 percent of out-of-state movement. In the Pacific Northwest, the wheat was divided into that destined for overseas shipment--71.3 million--and that for use in milling flour and bulgar products--21.2 million bushels.

Montana wheat made up 40 percent of all wheat leaving the Pacific Northwest ports in the June 1980 - May 1981 marketing period.

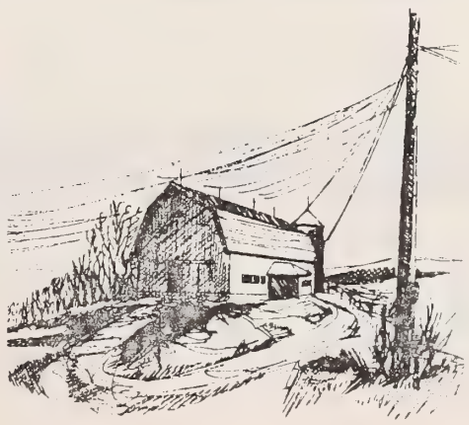
1981 WORLD WHEAT PRODUCTION

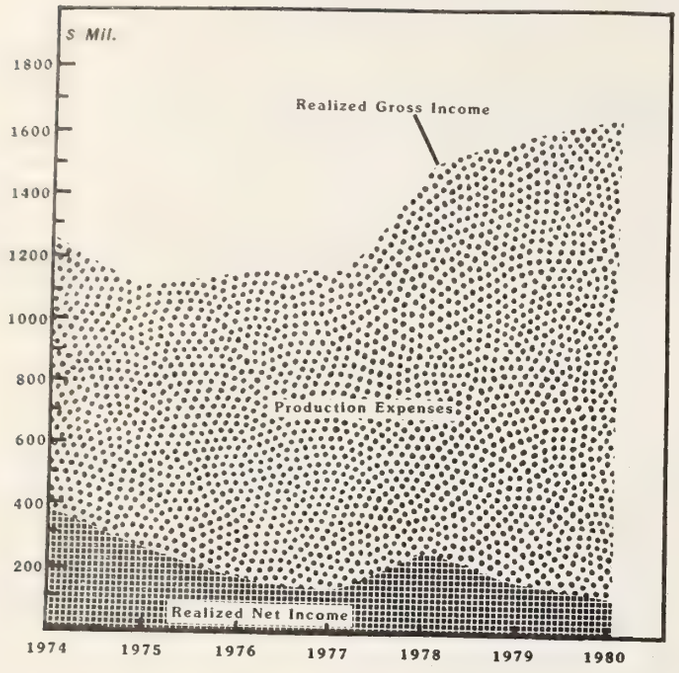
LARGEST EVER

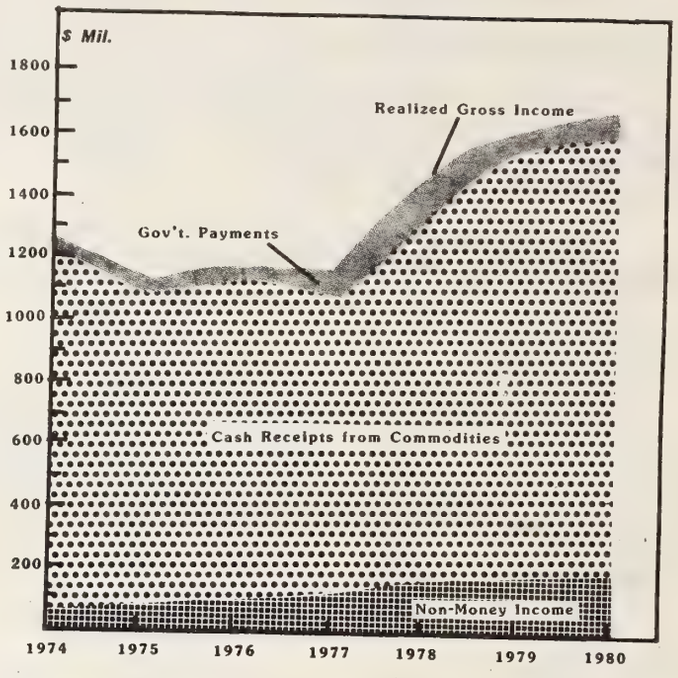
- The final 1981/82 world production will be around 452 million metric tons (16.6 billion bushels)--3 percent above last year.
- The U.S. share of total world production in 1981 was 16.8 percent.
- Record North American crops more than compensated for reduced harvests in Russia and Eastern Europe.
- Total production was at an all time high for the five major exporters.
- The Most significant reduction was a 10 million ton shortfall in the Soviet Union.
- World trade was also a record--expected to top 100 million tons for the first time to 101 million--40 percent above the average yearly trade for the 1970's.

Funds for wheat utilization and movement were furnished by the Montana Wheat Commission.



FARM INCOME COMPONENTS, MONTANA, 1974 - 1980





QUESTIONS FARMERS ASK ABOUT CROP and LIVESTOCK REPORTING . . . .

Don't these reports drive prices down?

Prices in a competitive market are determined by supply and demand. Any reports on weather, world famines, unemployment, yields, acreage, floods, etc. are going to have a short-run effect on prices. Remember, these things drive prices up as often as they drive them down. Fair prices depend upon all trading partners being equally informed.

CATTLE HERDS BUILD

Montana's total cattle and calf inventory increased 8% during 1981. Breeding animals (cows, replacement heifers) were up slightly more than 8%--pointing to further expansion in 1982. Montana herds are building faster then the national average (see charts page 2).

Although calves on hand are down, some of 1981's larger calf crop was reported in the 500 plus categories. On balance, Montana cattlemen are wintering about 5 percent more calves and yearlings than last year.

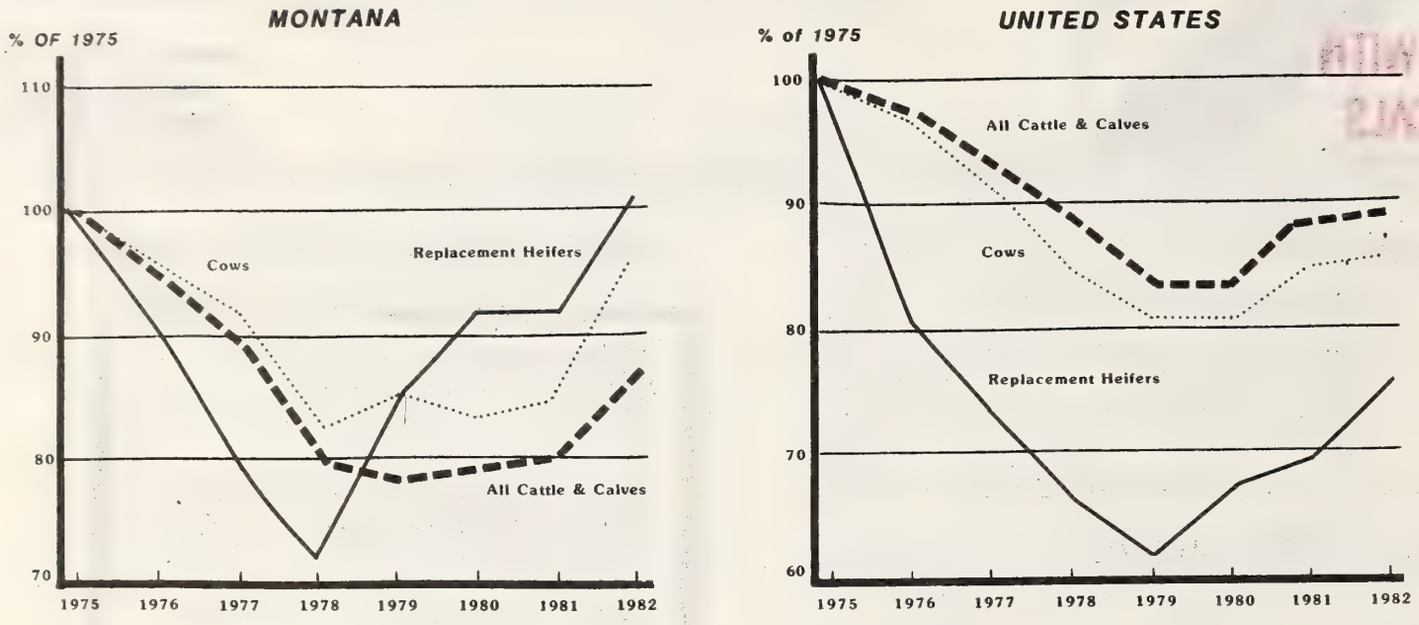
CATTLE HERDS BUILD--

MONTANA FASTER THAN NATION



Above charts refer to January 1 inventory.

SHEEP NUMBERS STRENGTHEN

Sheep numbers in Montana have climbed for the third straight year--up 4 percent from last year and 7 percent above the 1980 levels.

Breeding ewes were up 8 percent from last year, pointing to a larger lamb crop for 1982. However, ewe lambs kept for flock replacement were down 10 percent. This could mean sheepmen are tempering further herd build-up until prices improve.

MONTANA FARM PRICES SAG

Farm markets are responding to a weak economy coupled with supplies of products more than ample to match demand. The Montana index of prices received for all farm products in mid-January was 138 (1977=100), down 33 points from last year and 4 points under December.

Comparing mid-January 1982 prices with January 1981:

- Winter wheat was down 68 cents a bushel
- Spring wheat was down 53 cents
- Durum had fallen $2.56 a bushel
- Barley was down 53 cents
- Hay was priced $14.00/ton less
- All beef cattle were down $12.30 per cwt
- Lamb was down $5.20 per cwt

The bright spots:

- Hogs were selling $2.10 per cwt higher
- Eggs were up 5 cents a dozen
- Milk prices were unchanged.

On the national scene, **Parity**, which measures the purchasing power of farm products at current prices compared with prices during the 190-14 period, was **57**--the lowest since **March 1933.**

FARMER OWNED WHEAT STORED OFF FARMS DROPS SHARPLY

Montana wheat farmers held 1, 950,000 bushels of wheat in off-farm storage positions on January 1, 1982--down 85 percent from last year. This amount was about 8 percent of all wheat stored off-farms and amounts to a little over 1 percent of wheat stocks stored in all positions. This reduced farmer-owned wheat stored off farms--in spite of near record wheat stocks--reflects the build-up of farm storage that has occurred in the state the past few years.

Nationally, 40 percent of total wheat stored in off-farm positions was producer controlled--cown 4 points from last year.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 440,000 pounds of creamed cottage cheese during December 1981--up 11 percent from November, and alos up 7 percent from last year. Ice cream frozen at 108,000 gallons was 7 percent below last year. Butter made at 210,000 pounds was up 8 percent.

MONTANA RANKS 40TH

Chicken numbers on Montana farms dropped 3 percent during 1981, pushing the state to number 10--from the bottom. California ranks as number one. There are 13 states with over 10 million birds and these account for 69 percent of the total.

The December 1 inventory in Montana held 300,000 hens over a year old; 490,000 laying pullets; 143,000 pullets not yet laying and 7,000 other chickens.

RED MEAT PRODUCTION DECREASES

Montana slaughter plants produced 4 percent less red meat during December 1981 than the same month one year ago. Total production at 15.4 million pounds compares with 16.1 million pounds December 1980 and 15.5 million pounds in November 1981. Production for January-December 1981 at 169.2 million pounds is 8 percent less than the same period in 1980.

Commercial red meat production for the United States during December 1981 totaled 3.42 billion pounds, up 2 percent from December 1980. January-December 1981 red meat production at 38.6 billion pounds was virtually the same as the production during 1980. The 1981 annual production changes from 1980 by individual components were: beef, up 3 percent; veal, up 9 percent; pork, down 4 percent; lamb and mutton, up 6 percent.

Kill days for December included 23 weekdays (one a holiday), and 4 Saturdays, the same as a year ago.

MONTANA GRAIN BINS HOLD NEAR RECORD WHEAT STOCKS

Montana wheat farmers were storing near record amounts of wheat on January 1, 1982, exceeded only by stocks held on January 1, 1979.

Stocks disappearance since October 1 has been brisk--8 percent above last year and significantly higher than years prior to 1981. However, as a percent of total production, disappearance from all storage positions has not kept pace with the last two years.

Farmers are placing more wheat in government loan programs. As of December 31, 1981 nearly 46 percent more wheat was held under government loan program compared with December 1980, and 27 percent more was in the reserve program.

Wheat stored in the state is about 51 percent winter wheat, 41 percent hard red spring and 8 percent durum.

(See tables inside.)

FEEDLOT NUMBERS BELOW CAPACITY

On January 1 Montana feedlots held 17 percent fewer cattle and calves for slaughter than a year ago. The total, at 53,000 head, is the lowest since 1955 and reflects unprofitable feeding margins prevalent since mid-1979.

Cattle feeders in the 23 major feeding states show the same downward trend. The number of feeders in these feedlots were down 9 percent--the lowest since 1975.

Although not officially estimated, many Montana feedlots will 'warm-up' cattle only--that is, cattle not finished for slaughter but prepared for further feeding in other locations.

MORE POTATOES IN STORAGE

Montana producers had 1.63 million cwt in storage on January 1, 1982--1 percent above last year at this time.

There were 160 million cwt of potatoes in storage on January 1, 1982 in the 15 major states. This was 9 percent above January 1 a year ago, but 9 percent less than on January 1, 1980. Of the total stocks on hand in the 11 major states, 73 percent are Russets, 23 percent Whites and 4 percent Reds.

MONTANA BEES PRODUCE MORE HONEY

Montana's 1981 honey production, estimated at 10.8 million pounds, was 1 percent above the 1980 production level and is second only to the record crop of 13.2 million pounds produced in 1979. The number of colonies in 1981 at 108,000 was up 5 percent from a year ago. Yield per colony at 100 pounds was down from 104 pounds in 1980. Montana ranked fourth in 1981 U.S. honey production. Florida, North Dakota and Texas ranked first, second and third respectively.

The U.S. honey crop in 1981 totaled 186 million pounds, 7 percent less than the 1980 crop of 200 million pounds. The number of colonies at 4,213,000 was up 2 percent while yield per colony declined to 44.1 pounds from 48.2 pounds in 1980. Honey stocks on hand totaled 48.6 million pounds--20 percent above last year. The 1981 average price for all honey sales of 63.2 cents per pound was up 1.7 cents from 1980.

MORE MILK PRODUCED

Montana dairymen produced 5 percent more milk during the October-December period than a year earlier. Milk cows in the state held steady with year ago levels but production per cow jumped. The totals for the recent quarter are 83 million pounds of milk from 29,000 cows.

Most of the increase occurred in the state's commercial dairy herds and is a result of a more profitable milk/feed price ratio.

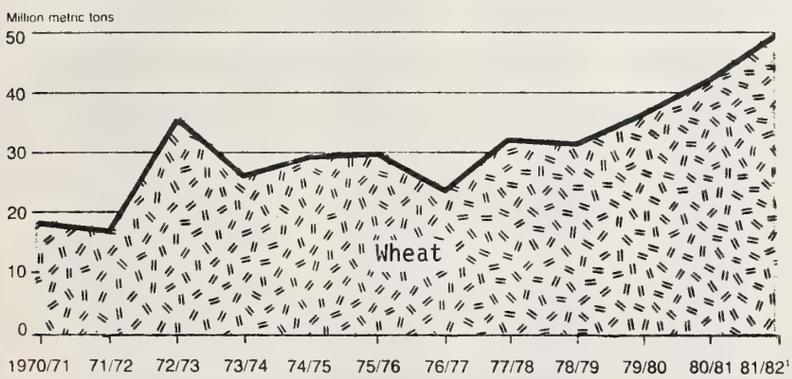
- Number of Farms Increase

U.S. WHEAT EXPORTS HEADED FOR NEW RECORD

The 1981/82 total sales of U.S. wheat abroad should hit **50 million tons.** This amount is nearly two-thirds of the Nation's 1981 all wheat output, or **almost 11 times the Montana 1981 wheat production**

U.S. Exports of Wheat Register Rapid Growth



¹Forecast.

Factors that will dominate exports this year include:

- Expanded Soviet imports.
- The return of India to the world market as in importer.
- Large imports by Turkey--normally an exporter.
- Growing imports in North Africa, Brazil and South Korea.

1981 FARM BILL HIGHLIGHTS 1/

Commodity	Loan	Target '82	Target '83	Target '84	Target '85
Wheat	$3.55	$4.05	$4.30	$4.45	$4.65
Corn 2/	2.55	2.70	2.86	3.03	3.18
Wool	Support at 77.5 percent of statuatory formula. Wool support price of $1.37 a pound for 1982				
Dairy	Minimum support price of $13.10 per cwt. for fiscal year 1982, which began Oct. 1 Minimum support prices of $13.25, $14.00 and $14.60 in FY-83/85 if purchases of surplus products by USDA exceed $1 billion during any one year. If purchases are below that level in any year, the minimum will be 70 percent of parity. Minimum 75 percent of parity in FY-83/85 if projected surplus purchases are less than 4 billion pounds of milk in 1983, 3.5 billion in 1984 and 2.69 billion in 1984				

1/ The new support levels for all commodities do not come into effect until the start of the 1982/83 marketing year for each commodity. Marketing year begins June 1 for wheat, barley and oats, October 1 for sorghum and corn.

2/ Sorghum, barley and oats support levels will be tied to the level for corn.

FARM PRICES DECREASE

The December Index of Prices Received by Montana Farmers and Ranchers for All Farm Products at 139 (1977=100) was down 5 percent from the revised November Index, and down 17 percent from December 1980. The All Crops Index at 146 was 5 percent below November and 20 percent below a year ago. The Livestock and Products Index at 133 was 6 percent below November and 13 percent below December 1980.

In comparing December prices with November prices decreases were noted for all crop items except oats and barley. The only livestock items to register increases were sheep, lambs and milk.

Nationally, the December Index of Prices Received by Farmers decreased 4 points (3.1 percent) from November to 126 percent of its January - December 1977 average. Contributing most to this decrease since November were lower prices for cattle, hogs, cotton, wheat, corn and eggs while higher prices for lettuce, milk and tobacco were partially offsetting. The Index was 19 points (13 percent) below a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates for December was 150 percent of its 1977 base. The Index was down 1 point from November but 6 points (4.2 percent) above a year earlier. Sharply lower prices for replacement livestock accounted for most of the decreases.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced an estimated 398,000 pounds of creamed cottage cheese during November--down seasonally from October but 7 percent more than November 1980. Ice cream frozen at 104,000 gallons was 18 percent below last year. Butter production at 197,000 pounds was up 7 percent from last year.

FARM NUMBERS UP SLIGHTLY

The number of farms and ranches in Montana during 1981 is estimated at 24,200, continuing the slow upward trend. For 1982, farm and ranch numbers are expected to increase about 200 to reach an estimated 24,400. The amount of land in farms is also showing an increase, from 62.6 million in 1981 to 63.2 million in 1982.

Since 1976, there has been a slow increase in units that meet the definition of a farm. The definition of a farm is units from which $1,000 or more of agricultural products were sold or normally would be sold during the previous year.

The number of farms in the United States in 1981 is estimated at 2.44 million, up 0.3 percent from the 2.43 million in 1980. West Coast states accounted for most of the increase, continuing the trend started in 1975. The preliminary 1982 estimate is 2.44 million. Total land in farms was 1,045 million acres for 1981, an increase of 0.2 percent from a year earlier. The preliminary estimate for 1982 is 1,046 million acres of land in farms.

HAY STOCKS HIGHER

January 1 hay stocks on Montana farms and ranches totaled 4,327,000 tons--7 percent more than on the same date last year. Hay supplies appear ample for the winter feeding season except for some localized areas of eastern Montana. On the first of January, about 75 percent of all livestock were being fed hay or supplements.

The United States hay stocks on farms January 1 totaled 99.9 million tons--9 percent more than a year earlier.

CATTLE INDUSTRY OUTLOOK

The charts show that 1981 was a poor year for the cattle industry with falling prices at year's end.

USDA's Outlook and Situation Report offers the following for 1982....

- A SLUGGISH ECONOMY will further dampen consumer budgets, keeping a lid on price gains for livestock at least through mid-1982.
- LARGER FEED SUPPLIES at lower costs--better forage prospects--moderating interest rates. All should help to hold down production costs.
- MEAT PRODUCTION in the first half of 1982 is expected to decrease 1 - 2 percent from last year helping to hold down price depressing supplies.
- ADDING IT ALL UP: Prices may improve only slightly until mid-spring. Consumers are forecast to have more money the last half of the year, but meat supplies are also expected to increase. Any price gains later in the year could thus be moderated.

SEASON'S GREETINGS

At times we need to slow our hectic pace of living, take stock and give thanks for the many benefits we enjoy in this country. The many freedoms granted us under our Constitution and Bill of Rights quickly come to mind, but often we fail to think of the tremendous advantages we enjoy because of our fantastic agricultural productivity. One U.S. farmer produces enough food and fiber for 68 people--48 Americans and 20 people in other nations. Only 10 years ago one farmer produced enough for 45 people! Food continues to be a bargain, taking about 17 cents out of each dollar earned. Food costs have increased slower than housing, transportation and medical care.

We are indeed fortunate to be blessed with favorable soil, climate and technology, but our biggets thanks must go to our farmers and ranchers who work long hours for small profits. Our statistics have measured the amazing productivity of our agricultural industry, but have also shown sagging returns on investment. These returns must improve to insure a healthy and prosperous agriculturla economy.

We who have the job of collecting the data and issuing the reports about Montana agriculture wish you a Merry Christmas and a Happy New Year.

PLEASE RETURN

MONTANA PASTURE and RANGE FEED CONDITION--DEC 1
by District as a Percent of Normal

DISTRICT	1979	1980	1981
Northwest	62	92	86
North Central	64	56	72
Northeast	59	30	55
Central	67	71	88
Southwest	77	93	84
South Central	66	73	86
Southeast	68	30	64
STATE	66	62	78

PASTURE AND RANGE CONDITION DOWN SLIGHTLY

Pasture and range feed conditions declined 1 point during November, but were 16 points above the same time last year. The northeastern and southeastern areas of the state showed the greatest improvement over last year at this time. About 80 percent of the cattle and sheep were on supplemental feed by December 1.

FERTILIZER CONSUMPTION INCREASES

Fertilizer consumption in Montana during the year ended June 30, 1981 totaled 341,127 tons, up 22 percent from the 280,463 tons consumed in the 1979-80 year. Mixed fertilizer accounted for 133,444 tons of the total, while 201,562 tons were primary nutrients and 6,121 tons were secondary and micronutrients used in direct application materials.

Fertilizer consumption in the U.S. and Puerto Rico during the year ended June 30, 1981 is placed at 53.3 million tons, up 1 percent from the 52.8 million tons consumed during the 1979-80 year.

Primary nutrient content (nitrogen, N; phosphate, P_2O_5; and potash, K_2O) was 23.5 million tons, up 2 percent from a year earlier. Nitrogen consumption increased 3 percent to 11.8 million tons; phosphate usate at 5.4 million tons and potash consumption at 6.2 million tons were unchanged.

The five leading States in order of total consumption and the change in consumption from last year were: Illinois, down 5 percent; California, down 7 percent; Iowa, up 4 percent; Texas, up 5 percent and Indiana, down 5 percent.

Fertilizer consumption represents all commercial fertilizer tonnage sold or shipped for farm and non-farm use as fertilizer. Materials used in the manufacture of registered mixes or for use in other fertilizer are excluded.

PROSPECTIVE PLANTINGS REPORT

The Statistical Reporting Service (SRS) will combine the January and March Prospective Plantings reports into a February 1 Prospective Plantings report to be released at 3:00 p.m. (EST) on February 18, 1982. The report will include expected plantings in all States for corn, durum and other spring wheat, oats, barley, flaxseed, cotton, rice, sorghum, sweet potatoes, dry edible beans, dry edible peas, soybeans, sunflowers, peanuts, sugarbeets and acreage for harvest of hay and tobacco.

A split intentions survey was conducted in 1981, with the southern States surveyed on January 1, and the northern States on March 1. The change to the February 1 Prospective Plantings report is a result of analysis of comments and recommendations from data users to provide a single report on prospective plantings for the Nation.

This action will provide data users an early season indication of farmers' planting intentions and at the same time allow time for producers to monitor markets and finalize their plans while SRS accomplishes required reduction in expenditures and reporting burden.

U.S. EXPORTS UP

U.S. exports of livestock and livestock products for January through August 1981 increased 4 percent to $2,169 million, compared with $2,079 million for the same period a year ago. Increased sales were realized in most areas, but the major commodities traded in this area (tallow and greases, hides and skin, and furskins) were each down somewhat. Beef and veal, which account for 9 percent of the overall export sector, gained 19 percent to $192 million, with quantities up 21 percent to 47,566 metric tons (MT). U.S. export levels to Japan, the major purchaser of beef and veal, increased 19 percent to 26,678 MT. Shipments to Canada increased 85 percent in value, and the quantity (5,403 MT) caused Canada's share of U.S. beef exports to reach 11 percent. Mexico also continues to absorb larger purchases due to increased demand, and during January through August 1981, this market showed a 79 percent gain over the same period a year ago to 1,182 MT.

Pork exports rose 63 percent to $184 million, with the quantity shipped increasing 31 percent to 69,426 MT. Japan, the largest market for U.S. pork products (about 48 percent of total exports), increased 90 percent to 33,329 MT. U.S. exports to Mexico and the Caribbean area, two other important markets, increased by 37 and 31 percent, respectively. Shipments to Canada declined 6 percent to 7,840 MT because of their lower domestic prices relative to U.S. pork.

Tallow and greases account for about 22 percent of the livestock products export market. Sales in this category dropped by 6 percent to $468 million. This reduction reflects lower shipments to Japan, Mexico, and the United Kingdom. Hides and skins, another large segment of the export market (21 percent), experienced a slight drop of 2 percent to $463 million. Furskins dropped 11 percent to $270 million.

Taken collectively, the live animal sector does not constitute a large segment value-wise, but gains were seen in all categories.

NOVEMBER FARM PRICES

The November Index of Prices Received by Montana farmers and ranchers for All Farm Products at 148 (1977=100) was up slightly from the revised October index. The All Crops Index at [illegible] was up 1 percent from October but 16 percent below a year ago. The Livestock & Products Index at 145 was 3 percent below October and 12 percent below November 1980.

In comparing November prices with October prices, increases were noted for winter wheat, spring wheat, durum wheat and barley while oats prices declined. All livestock items showed decreases except for steers & heifers, calves and eggs. Wool prices remained unchanged from last October.

Nationally, the November Index of Prices Received by Farmers decreased 1 point (.8 percent) from October to 129 percent of its January - December 1977 average. Contributing most to the decrease since October were lower prices for cattle, hogs, corn, grapefruit and lemons. Higher prices for oranges, eggs, strawberries, potatoes and milk were partially offsetting. The index was 15 points (10 percent) below a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates for November was 151 percent of its 1977 base. The index was unchanged from October but 7 points (4.9 percent) above November 1980.

Greetings

The snow's afly'n
it's a blizzardy storm.
The collie's in the kitchen
try'n t'keep warm.

Pa's in the meadow,
a check'n the cows,
While the kids like Injuns
are destroy'n the house.

Ma's been real busy,
with cookies and cakes,
(But we always eat leftovers
whenever she bakes.)

The Christmas Day menu,
it's all a big plan,
And that ornery old gander
will spend Christmas in a pan.

We're all wait'n for Santy
and his sled fulla joys.
The kids need new coats,
but he'll prob'ly bring toys.

The tree's all trimmed
with angels and elves,
It's jist a scraggly old pine,
but we cut it ourselves.

So with a New Year a'comin,
a resolution that hence,
We'll do our level darndest,
t'keep up half the fence.

From all of our gang,
from our hold-up out here,
"Have a Very Merry Christmas,
and a Sassy New Year".

OCTOBER SLAUGHTER DOWN

Montana slaughter plants produced 16.0 million pounds of red meat in October, 5 percent less than the same month last year. Accumulated production for the year January-October lags behind last year by 9 percent. October cattle slaughter at 11,500 head was 23 percent below a year ago, but hog slaughter at 54,000 was up 17 percent.

Commercial red meat production for the United States during October 1981 totaled 3.43 billion pounds, 4 percent less than October 1980. January-October red meat production at 32.0 billion pounds was down less than 1 percent from the corresponding period in 1980. The 1981 accumulated production changes from the 1980 period by individual components were: beef, up 3 percent; veal, up 9 percent; pork, down 5 percent; lamb and mutton, up 5 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for October included 22 weekdays (one a holiday) and 5 Saturdays compared with 23 weekdays (one a holiday) and 4 Saturdays a year ago.

TIGHTER FREE SUPPLIES OF WHEAT IMPROVE PRICE OUTLOOK

An alltime high 80.7 million acres harvested and generally favorable weather and soil moisture, which boosted the national average yield to a near-record 34.1 bushels an acre, brought about this year's record wheat crop. The October 1 production estimate of 2.75 billion bushels exceeds the 1980 record by 380 million. On the strength of this crop, the total supply for the marketing year rose 14 percent to 3.74 billion bushels, also the largest ever. However, given expectations for record exports and increased wheat feeding, total 1981/82 disappearance will likely exceed production, lowering year-end stocks. Over 70 percent of the carryover may be held in the farmer-owned reserve or by the Commodity Credit Corporation.

This year's record wheat supply and substantially larger U.S. feed grain and soybean supplies have depressed wheat prices to the lowest early season level in 3 years. Despite exceptional export sales, increased farmer use of the loan and reserve programs, and prospects for reduced carryover, farm prices are still below a year ago. Nevertheless, they have advanced slowly. Further price strength is expected, as free supplies of wheat continue to tighten. The timing and quantity of foreign purchases, crop developments in the Southern Hemisphere, and the outlook for the 1982 U.S. winter wheat crop will also influence prices. However, the average farm price is still likely to be below last season's $3.96 a bushel, falling within $3.80 to $3.95. June-October farm prices have been below the target price of $3.81 a bushel, so eligible producers will receive a deficiency payment of around 15 cents a bushel for the 1981 crop. Payments are estimated to total about $400 million.

U.S. exports will likely expand dramatically in 1981/82 because of a significant increase in world import demand. With U.S. supplies more than adequate to meet booming demand, wheat exports are projected at 1.9 billion bushels (51.7 million metric tons). This is a fourth larger than last season's record and means that the United States will account for half of all global wheat trade in 1981/82. World importers will buy nearly 70 percent of the 1981 U.S. crop.

Dry conditions have tempered the outlook for the Southern Hemisphere's wheat crop, but this season's global output is expected to reach a record 448 million metric tons. The most significant reduction is a projected 8-percent shortfall in the Soviet Union--the world's largest wheat producer. The outlook for continued-large world wheat use will help push global trade about a tenth above last year's record.

The 1982 U.S. wheat plantings will probably not repeat last year's alltime high primarily because of an announced 15-percent acreage reduction program. However, current reports indicate vigorous winter wheat planting because of favorable soil moisture and low prices for alternative crops.

MEDITERRANEAN DURUM IMPORTS SEEN INCREASING

Durum imports by Algeria, Italy, Tunisia and Morocco in 1981/82 are expected to increase 775,000 tons over the preceding year to 2.9 million tons. These four Mediterranean countries surveyed in October 1981 have accounted for about one-half of world Durum imports and much of the year-to-year swings in Durum trade over the past decade. All Mediterranean countries combined have taken an average of three-fifths of world Durum imports, with total imports expected to increase to 3.5 million tons this year.

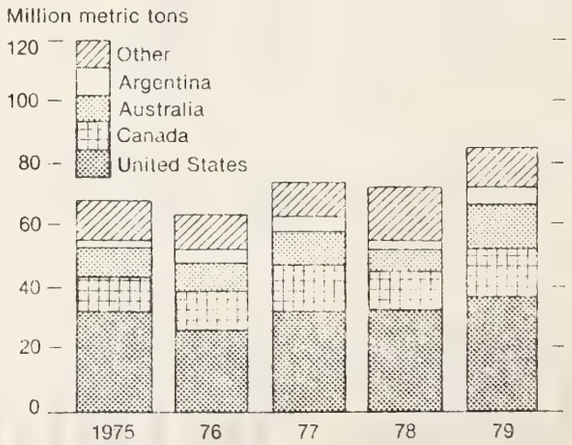
The United States and Canada, which together account each year for nearly all of the world's Durum exports, have ample supplies to satisfy the 3.5-million-ton Mediterranean import requirement. The United States had a record 1981 crop of 5.0 million tons (2.9 million in 1980), and Canada's crop also is up sharply this year to 2.7 million tons (from 1.9 million).

Increased export availabilities, lower prices and reduced crops in the Mediterranean area are stimulating trade. U.S. Durum exports, which were 1.6 million tons in 1980/81, down from a record 2.3 million in the preceding year, now are forecast to rebound to 2.2 million tons or higher in 1981/82. From June 1 to October 23, total U.S. export sales of durum were 1.6 million tons, up 37 percent from the comparable period in the preceding year. In addition to the countries mentioned, other sales have been made to nontraditional markets, such as Brazil and Kenya.

Larger Durum supplies have caused Durum prices to fall despite increased demand. Durum, #3 Hard Amber, is running over $100/per ton lower this season than last season, and has remained relatively unchanged for the past two months.

Since prices for other wheat classes have not fallen as sharply, the differential between Durum and other classes of wheat is much samller this year. If Durum sales continue strong, Durum prices could show some uptrend from present levels.

Major Wheat and Flour Exporters



Includes wheat equivalent of flour and products. Marketing year beginning July 1. 1979 preliminary.

EXPORT FORECAST

U.S. agricultural exports are forecast to increase 4 percent to about $45.5 billion in fiscal 1982, with anticipated lower prices for grains and oilseeds limiting the projected gain. Volume may climb a tenth to about 180 million tons. However, there is still considerable uncertainty about U.S. exports, depending on world economic conditions and crop developments. Agricultural imports are expected to remain at last year's $17 billion. Therefore, the agricultural trade surplus may exceed $28 billion, up from $26.7 billion in fiscal 1981.

Much of the expansion in U.S. exports will be in shipments to the USSR, which should reach a record. In the extension year of the U.S.--USSR Grain Agreement, the United States has offered the USSR 23 million tons of wheat and corn. Also, the Soviets have purchased 500,000 tons of U.S. soybeans. In many developed and middle-income countries, sluggish economic conditions are limiting the import demand for foodstuffs, raw materials, and livestock feeds. Lack of foreign exchange is also forcing many countries, such as Poland, to restrict imports.

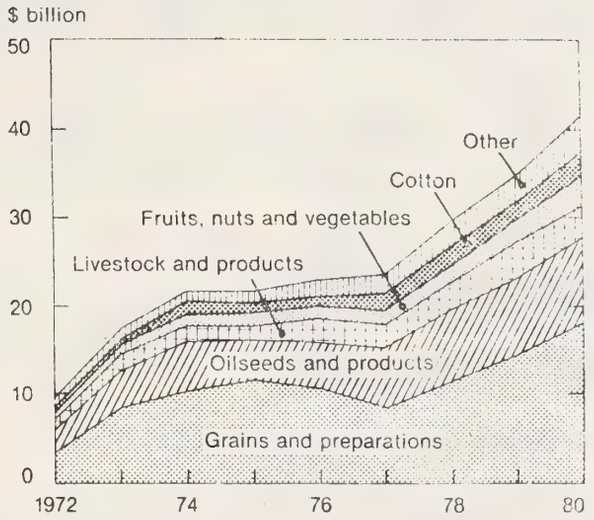
Lower unit values for grains and oilseeds are expected to offset higher prices for some other agricultural products. The unit value of corn may decline almost a tenth, and wheat is estimated down about 2 percent. The unit values for soybeans, protein meal and rice are forecast to drop around 15 percent each.

Grain exports are expected to increase about 12 million tons in fiscal 1982, following last year's 4-million-ton gain. Much of the rise is due to crop shortfalls notably in the USSR and Spain. Mainly because of low domestic procurement, India is presently expected to import up to 4 million tons of wheat, mostly form the United States. Continuing increases are forecast for grain shipments to other developing countries in Asia and Africa. U.S. rice exports are projected to decline sharply because of the reduced import needs of South Korea and Indonesia.

Competition from foreign grain exports may slacken. Argentina and South Africa, which provided strong competition late in fiscal 1981, are not likely to repeat their record harvests of last spring. In addition the European community is forecast to reduce exports. However, Canada and Australia should expand exportable supplies.

U.S. soybean and product exports are expected to partially recover from fiscal 1981's reduced volume. The U.S. share of world trade may increase, because available supplies from South America in 1982 are projected down. Cotton exports may be up a fourth, because world trade will likely increase slightly, and U.S. prices are more competitive than last year. Exports of animals and animal products should rise from $4.2 to $4.8 billion.

U.S. Agricultural Exports by Commodity



CATTLE ON FEED DOWN

Cattle and calves on feed November 1 for slaughter market in the 7 states preparing monthly estimates totaled 7.11 million head, down 9 percent from a year ago and off 11 percent from November 1, 1979. This is the lowest November 1 number on feed in the 7 states since 1974.

MARKETINGS of fed cattle during October totaled 1.45 million, down 8 percent from a year ago and off 12 percent from 1979.

PLACEMENTS of cattle and calves on feed in the 7 states were 2.05 million, down 9 percent from last year and 14 percent below 2 years ago. Placements in the 7 states during October were the lowest since 1974.

NET PLACEMENTS of 1.96 million were down 7 and 12 percent from 1980 and 1979, respectively.

OTHER DISAPPEARANCE totaled 85 thousand compared with 130 thousand during October 1980 and 144 thousand 2 years ago.

Ratio 2/	66	57	100	85

1/ Mid-month Index. 2/ Ratio of Index of Prices Received by Farmers to Index of Prices Paid, Interest, Taxes and Farm Wage Rates.

OCTOBER FARM PRICES DOWN

The October Index of Prices Received by Montana farmers and ranchers for All Farm Products at 148 (1977=100) was down 2 percent from the revised September index. The All Crops Index at 147 was up slightly from September, but 16 percent below a year ago. The Livestock and Products Index at 149 was 4 percent below September and 17 percent below October 1980.

In comparing October prices with September prices, decreases were noted for the following crop items: barley, oats and winter wheat. All livestock items except sheep, lambs, milk and eggs showed decreases.

Nationally, the October Index of Prices Received by Farmers decreased 5 points (3.7) percent from September to 129 percent of its January-December 1977 average. Contributing most to the decrease were lower prices for cattle, hogs, potatoes, corn and oranges. Higher prices for cotton, milk and grapefruit were partially offsetting. The index was 13 points below a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates for October was unchanged from September at 151 percent of its 1977 base. Lower prices for replacement livestock, feed and fertilizer were offset by sharply higher family living costs. Compared with a year earlier, the index was up 9 points.

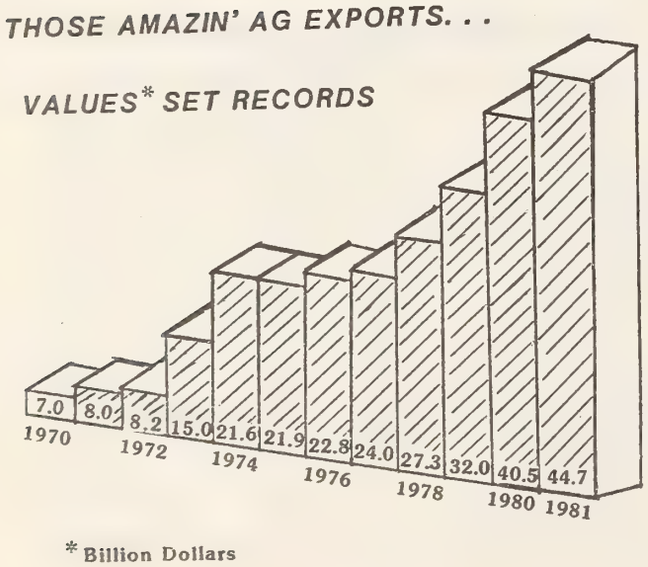
U.S. AG EXPORTS

U.S. agricultural exports are big business these days. In fiscal 1981, (October '80 - September '81) $45 billion worth of farm products will be shipped overseas. This is the 12th straight record year in U.S. export values--starting from a lowly 7 billion in 1970. This year's export dollars will climb 10 percent over 1980, but are up a sharp 40 percent from two years ago. Most of this year's increase is due to higher product prices as volume has changed very little on a total tonnage basis. Exceptions to this were wheat and flour with a 15 percent increase in tonnage shipped over fiscal '80; and beef, pork and variety meats which were up 18 percent.

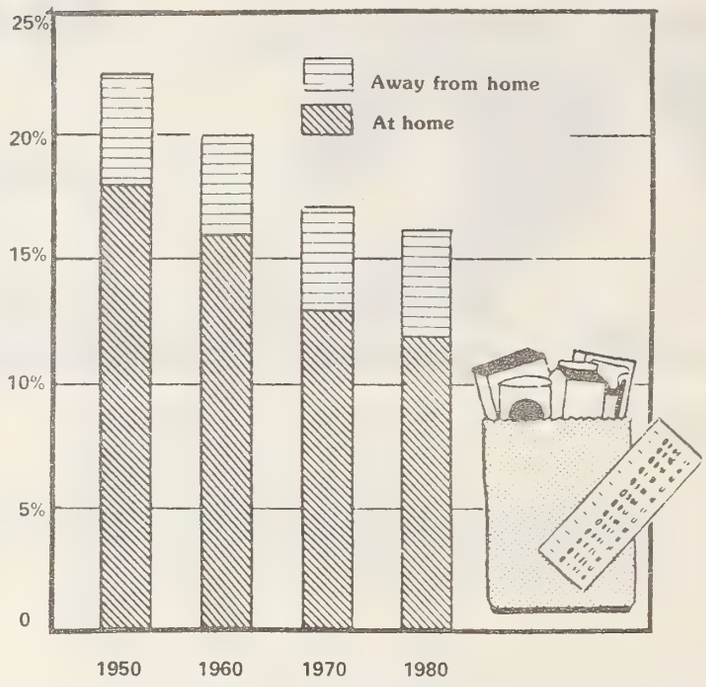
Imports in fiscal '81 are expected to total nearly $17 billion, about the same as a year earlier. This will result in an agricultural trade surplus of a record $27 billion, up 17 percent from last year. This means agriculture has again provided the dollars to pay for foreign oil, cars, clothing, electronic equipment and other non-farm products.

Export prospects for next year point toward a significant increase in volume as U.S. farmers expect record or near-record crops--but prices will probably average below last year. Wheat exports are expected to increase another 10 percent over this year's record. This will again test our transportation and grain handling systems.

How can U.S. farmers stay competitive in world markets? Many economists say that since the acreage expansions of the 1970's cannot continue, most gains in production will have to come from higher yields. If that's the case, agricultural research and technology, and advancement in farm management techniques will play a bigger role in keeping up with the competition.



PERCENT OF DISPOSABLE PERSONAL INCOME SPENT ON FOOD



HOW MANY POUNDS OF FOOD?

The average American ate 1,042 pounds of food last year but paid proportionately less for it than in 1960, according to a recent U.S. Department of Agriculture study.

Consumer expenditures climbed 319 percent from 1960 to 1980 but, proportionately, food gained less than other items in the consumer's budget. In 1960, about 20 cents of each dollar of disposable income went for food. Last year, food took about 16 cents of the disposable dollar, the survey showed.

In the last 20 years, shifts in consumption patterns affected many products. Consumption of frozen orange juice, for example, increased 98 percent, from 4.6 pounds per capita in 1960 to 9.1 pounds last year. Beef consumption per capita was up 21 percent, from 64.3 to 78.1 pounds. Beef consumption has been dropping each year since 1976 when it hit a record 95.7 pounds per capita.

Chicken consumption also gained dramatically going from 27.8 pounds per person in 1960 to 51.2 pounds in 1980--an 84 percent increase. The biggest gainer was cheese, going from 8.3 pounds per capita to 17.9, an increase of 116 percent.

But some foods lost ground. Potatoes dropped from 80.4 pounds per person in 1960 to 44.4 in 1980, a loss of 45 percent. Egg consumption declined 17 percent, from 42.4 pounds per capita in 1960 to 35.4 twenty years later.

All fluid milk consumption decreased from 290 pounds per capita in 1960 to 243 per pound last year. Other losers were sugar, down 12 percent, and fresh peaches, down 38 percent.

AGRICULTURE TRADE BALANCE COULD SET RECORD

Agricultural imports are expected to total $17.3 billion, about the same as last year. This will result in an agricultural trade balance for 1981 of a record $27.3 billion, according to recent reports from the U.S. Department of Agriculture.

Farm exports have been increasing much faster than imports, creating a favorable balance in agricultural trade. During the first nine months of fiscal year 1981, farm exports totaled $34.8 billion, 12 percent more than a year earlier. However, imports of supplementary products--those generally grown here--totaled $8.7 billion, 17 percent higher than a year earlier and well on their way towards a new record high for the 12th straight year.

Imports of complementary products--those not generally produced here--totaled $4.7 billion, 19 percent less than a year earlier. However, imports of supplementary products--those generally grown here--totaled $8.7 billion, 17 percent higher than a year earlier. That pushed the overall farm import total for the nine-month period to $13.4 billion, 1 percent more than last year.

Agriculture has been the brightest spot in the U.S. trade picture. While non-agricultural trade has been in deficit, farm exports have exceeded imports of those products, producing an agricultural trade surplus to be applied against the deficit in non-agricultural trade.

For the nation as a whole, agricultural trade contributes billions of dollars yearly to the balance of trade, which bears directly on the strength of the dollar in international currency markets.

USDA officials say farm exports have become basic to the economic health of the U.S., not only on the farm but in business and industry as well. Every dollar that is returned to the farm sector from exports is more than doubled in the economy.

SOURCE: ASCS Farm News

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 452,000 pounds of creamed cottage cheese during September, down seasonally from August, but 5 percent more than September 1980. Ice cream production at 170,000 gallons showed less than the usual season decline but was 7 percent below last year. Butter, showing a stronger than usual August to September increase, totaled 161,000 pounds--up 18 percent from last year.

RAIN IMPROVES PASTURES AND RANGES

Moisture received during October improved Montana's pasture and range feed conditions. The November 1 condition averaged 79 percent--up 2 points from October 1 and 16 points above last year at this date.

Most livestock have been moved from summer ranges. Stockwater supplies are generally adequate except in the eastern part of the state.

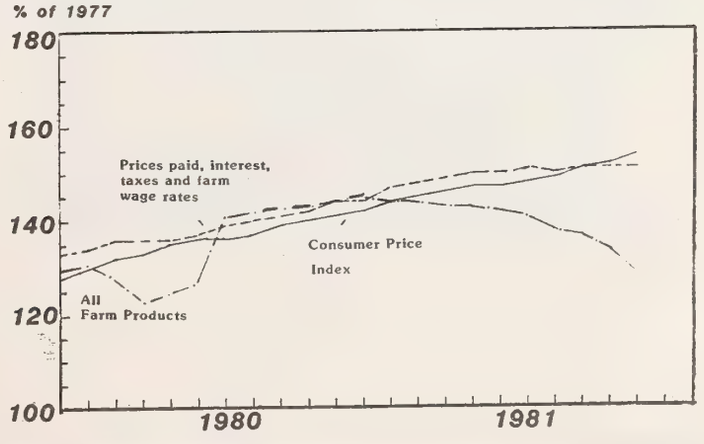
INDEX OF PRICES PAID & RECEIVED BY FARMERS, U.S.



WORLD ECONOMIC ACTIVITY SLOW; PRICES DECLINING

Global economic activity remains slow and will continue so at least well into 1982. Developed nation's attempts to lower inflation caused sluggish economic growth, declining trade and high unemployment. While inflationary pressures seem to be subsiding, overall inflation remains up. Sluggish demand in industrialized countries is slowing trade. For developing nations, only exporters of oil and some manufactured products are expected to perform well.

The U.S. dollar continued to appreciate relative to the German mark, Japanese yen, British pound and Dutch guilder through July and August. The Canadian dollar also declined relative to U.S. currency. However, the yen is expected to strnegthen.

The steady strengthening of the dollar has helped push commodity prices downward. World prices for grain and soybeans and products dropped during the summer. U.S. import prices for many commodities fell, led by bearish markets for coffee and rubber. Farm prices continued to slide, because good weather in July and August boosted prospective 1981/82 supplies.

Slaughter

FARM PRICES AND THE AGRICULTURAL ECONOMY

The agricultural sector has been facing declining prices in response to this year's large U.S. and world crops. Although final provisions of the 1981 farm bill and the appropriations process will affect the outlook, agricultural prices are unlikely to rise significantly in the near-term because of weakened worldwide economic conditions. October's upward revision of U.S. export estimates--mainly reflecting deteriorating Soviet crop prospects--was offset by larger projections for U.S. crops.

Total cash receipts in 1981 are expected to be up 4 to 6 percent, with receipts up 2 to 4 percent for livestock and 6 to 8 percent for crops. However, an 8 to 10 percent rise in farm production expenses, led by interest and energy-based inputs, will outstrip gains in cash receipts. As a result, net farm income, before inventory adjustment, is now projected at $17 to $21 billion, compared with $21.9 billion in 1980. After inventory adjustment, net farm income is still forecast at $20 to $24 billion--a slight improvement over last year's $19.9 billion.

NOTABLE NUMBERS

Value of U.S. agricultural exports for 1980 reached 41.3 million dollars, 19 percent above the previous year.

MILK PRODUCTION HIGHER

Montana milk production during the third quarter (July-September) of 1981 was 2 percent above the same quarter last year. The number of cows milked during this quarter averaged 29,000, the same as the previous year. The amount of grain fed per milk cow in herds on October 1 was 13.0 pounds per day, up 1 pound from October 1 a year ago.

MORE GRAIN IN STORAGE

Wheat stored on Montana farms and in mills and elevators October 1, 1981 totaled 203.1 million bushels--up 16 percent from a year ago. The larger stocks are primarily due to a larger wheat crop in 1981. On farm storages accounted for 84 percent of the total wheat stocks.

Winter wheat stored in the state at 100.6 million bushels was up 13 percent from last year. All spring wheat was up 18 percent with 102.4 million bushels in storage. The durum portion at 14.6 million bushels was 35 percent above last year. Barley stocks in all positions at 50.5 million bushels were 14 percent higher than last year. Oats at 5.7 million bushels were up 18 percent.

Nationally, all wheat stored in all positions as of October 1, 1981 totaled 2.70 billion bushels, 9 percent more than the 2.47 billion bushels on hand a year earlier. Farm stocks of 1.17 billion bushels account for 43 Percent of the total. Wheat stored in off-farm storage facilities totaled 1.53 billion bushels or 56 percent of the total. Durum wheat stocks on October 1, 1981 totaled 187 million bushels, 52 percent more than last year's 123 million bushels. Farm stocks accounted for 78 percent of the total or 146 million bushels. Barley stocks in all positions on October 1, 1981 totaled 446 million bushels, 14 percent more than a year earlier. Stocks of barley stored on farms amounted to 298 million bushels or 67 percent of the total stocks. Off-farm storage held 148 million bushels on October 1, 1981, or 33 percent of the total.

CATTLE ON FEED NUMBERS DOWN

Cattle and calves on feed on October 1 in Montana feedlots for the slaughter market totaled 30,000 head--23 percent less than last October and 25 percent less than the number being fed on July 1. Steers on feed at 15,000 are down 12 percent from last October, and heifers at 15,000 head are down 32 percent. About 93 percent of all steers and heifers on feed weighed 700 pounds or more--47 percent weighed 900 pounds or more. Placements in lots during the July-September period totaled 16,000 head--the same as last year. Montana feeders expect to market 17,000 head during the October-December period, 26 percent less than the same period in 1980.

In the 23 major feeding states, cattle and calves on feed October 1, 1981 for slaughter market totaled 9.03 million head, 9 percent below both a year earlier and 2 years ago. This is the lowest October 1 number on feed since 1967. All weight groups for heifers and steers are below a year earlier except the heaviest weight group of steers which is 1 percent above last year. Placements during the July-September quarter totaled 5.67 million, 11 percent below the same quarter last year and 5 percent below the comparable period in 1979. Placements for the July-September 1981 quarter were the lowest since 1974. Marketings of fed cattle for slaughter during July-September totaled 5.93 million, up 4 percent from the same quarter last year but 1 percent below July-September of 1979. Cattle feeders expect to market 5.49 million head during the October-December quarter of 1981. This would be 3 percent less than fourth quarter marketings in 1980 and 5 percent below 1979.

RED MEAT OUTPUT DOWN

Montana slaughter plants produced 14.5 million pounds of red meat in September, 4 percent less than the same month last year. Accumulated production for the year January-September lags behind last year by 10 percent.

September cattle slaughter at 10,800 head was 17 percent below a year ago, but hog slaughter at 47,300 was up 12 percent.

Commercial red meat production for the United States during September 1981 totaled 3.24 billion pounds, up 1 percent from September 1980. January-September red meat production, at 28.6 billion pounds, was virtually the same as the corresponding period in 1980. The 1981 accumulated production changes from the 1980 period by individual components were: beef, up 4 percent; veal, up 9 percent; pork, down 5 percent; lamb and mutton, up 5 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for September included 22 weekdays (one a holiday) and 4 Saturdays, the same as September 1980.

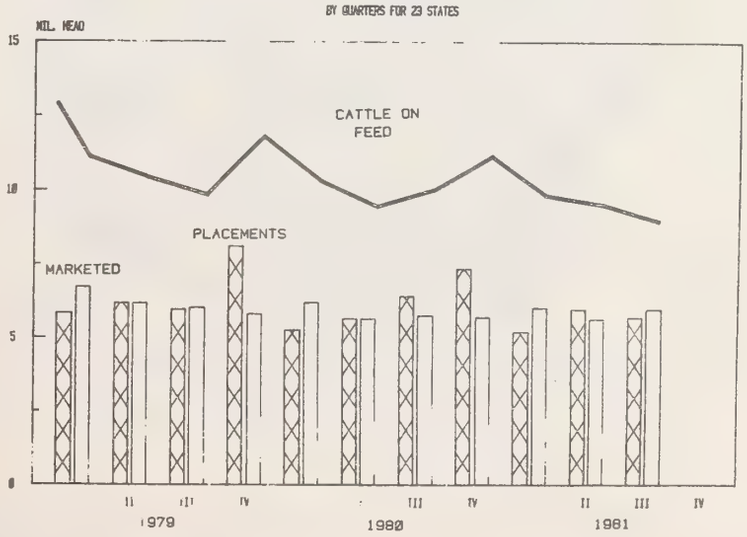
CATTLE ON FEED, PLACEMENTS, MARKETINGS

BY QUARTERS FOR 23 STATES



MORE ALFALFA SEED PRODUCED

Montana's 1981 alfalfa seed crop is forecast at 4.3 million pounds--up 3 percent from last year's crop. Acres for harvest are down 9 percent, but yield per acre at 135 pounds is up 15 pounds from 1980.

Drought effects during 1980 and again this spring prompted many part-time growers to harvest alfalfa as hay rather than cut it for seed. However, with the introduction of leaf cutter bees, many farmers and ranchers are growing alfalfa for seed as a full-time business with very good yields.

The United States alfalfa seed crop forecast at 117.0 million pounds is 15 percent above last year. Acreage for harvest is down 11 percent from 1980. Yields are expected to average 308 pounds per acre--up 70 pounds from last year.

NOTABLE NUMBERS

Richland County ranked number one in Montana oats production for 1979.

WHEAT FORECAST OFF SLIGHTLY

. . . STILL A RECORD CROP

The expected 1981 all wheat production for Montana at 173.3 million bushels will surpass the 1976 record wheat crop by 4 percent. The October 1 forecast is down slightly from last month due to a 7 percent reduction in durum wheat production. Both winter and hard red spring forecasts remained unchanged from last month. The ideal harvesting weather during September has permitted harvest of small grains to be virtually complete by October 1.

Durum wheat production, at 11.9 million bushels, is still 56 percent above last year and the second largest crop--the record was the 1956 crop of 18.1 million. Winter wheat, at 90.0 million is 64 percent above last year and third largest on record. Hard red spring, at 71.5 million, is 25 percent above last year and the largest ever. The previous record was 60.2 million in 1976. Barley, at 57.2 million, and oats, at 5.5 million, are 30 and 71 percent respectively above 1980.

The first forecast of 1981 potato production at 1.9 million hundredweight is 7 percent above last year. Sugarbeet production at 860 thousand tons is unchanged from last month, but 2 percent below 1980. The first forecast of 1981 hay production at 4.3 million tons is 3 percent above last year.

PASTURE AND RANGE DRY

Pasture and range condition declined during September and the October 1 reported condition averaged 4 points below last month, but 18 points above last year's unusually poor October 1 condition. Most of the eastern part of the state is very dry, but stubble fields are providing some grazing. Most range grass is dry and brittle due to the hot dry weather during most of September. However, most of the state received some moisture the last of September which should make the range grass more palatable, and also decrease the danger of range fires which has been very high.

SEPTEMBER PRICES SLIGHTLY LOWER

The September Index of Prices Received by Montana farmers and ranchers for All Farm Products at 150 (1977=100) was down 1 percent from the revised August index, and down 14 percent from September 1980. The All Crops Index at 145 was 3 percent below August and 14 percent below a year ago. The Livestock and Products Index at 154 was 1 percent above August, but 15 percent below September 1980.

In comparing September prices with August prices, winter wheat, barley and oats prices declined while the durum price increased, and the spring wheat price remained unchanged. The Livestock Items that showed increases were steers & heifers, beef cattle, calves, milk and eggs. Cow, sheep, lamb and hog prices declined.

For the Nation, the September index of prices received by farmers decreased 3 points (2.2 percent) from August to 134 percent of its January-December 1977 average. Contributing most to the decrease since August were lower prices for corn, potatoes, soybeans, oranges and cattle. Higher prices for milk, eggs, peaches, tobacco and apples were partially offsetting. The index was 8 points (5.6 percent) below a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates for September was unchanged from August at 151 percent of its 1977 base. Higher prices for family living items, replacement livestock and farm machinery were offset by lower feed prices. Compared to a year earlier, the index was up 10 points (7.1 percent).

MANUFACTURED DAIRY OUTPUT HIGHER

Montana dairy plants produced 526,000 pounds of creamed cottage cheese during August, 6 percent less than during July, but 12 percent more than August 1980. Ice cream production at 187,000 gallons was 12 percent below the previous month, but 1 percent above August last year. Butter production totaled 127,000 pounds, up 10 percent from August 1980.

VALUE OF 1980 MONTANA POTATO CROP UP SHARPLY

Potato producers in Montana sold 1,485,000 cwt. of potatoes from the 1980 crop--4 percent less than the previous year. Producers sold 86 percent of the 1,725,000 cwt. produced in 1980. Shrinkage and loss accounted for 7 percent, while 8 percent were used for seeding the 1981 crop.

Value of production at $14,663,000 was 126 percent more than the 1979 crop and value of sales at $12,623,000 increased 128 percent from the previous year. Average price for the 1980 crop sales was $8.50--up $4.90 from the previous year.

FINAL SURVEY OF 1981 CROP PRODUCTION

Throughout the 1981 crop year the Montana Crop and Livestock Reporting Service has been making monthly production forecasts for the state's major crops. As the harvest of most crops is nearing completion plans are being made to conduct a survey to obtain final 1981 data on acreage, yield and production for the major crops. The latter part of October, about half of Montana's farmers and ranchers will be mailed questionnaires requesting crop information. To assure adequate coverage and accurate results, telephone calls will be made to some of those who do not return the questionnaire. Similar surveys will be conducted in other states, and final state and national figures will be published December 22 for small grains, and after the first of the year for other crops. All data is confidential and used only to provide reliable county and state production statistics.

LARGER SWEET CHERRY CROP

Sweet cherry production in Montana for 1981 is estimated at 1,250 tons. This is 79 percent above the poor 1980 crop. However, this year's production is still only 42 percent of the record 1979 crop. The major contributing factors to this year's poor crop production were poor pollination caused by cool wet weather and widespread brown rot. Though the production was low, the quality of fruit was very good. Value of production for the state was $954,000 which was considerably higher than the 1980 crop value at $435,000. Average price per ton in Montana was $763.

Production of sweet cherries for the United States is estimated at 154,000 tons. This is 10 percent less than the 1980 crop and 15 percent below the record 1979 crop. Average price per ton increased 40 percent over last year to $771.

Washington was the leading producer with 48,000 tons followed by Oregon with 39,000 tons, California with 32,600 tons and Michigan with 23,000 tons. These 4 states accounted for 93 percent of the total U.S. production.

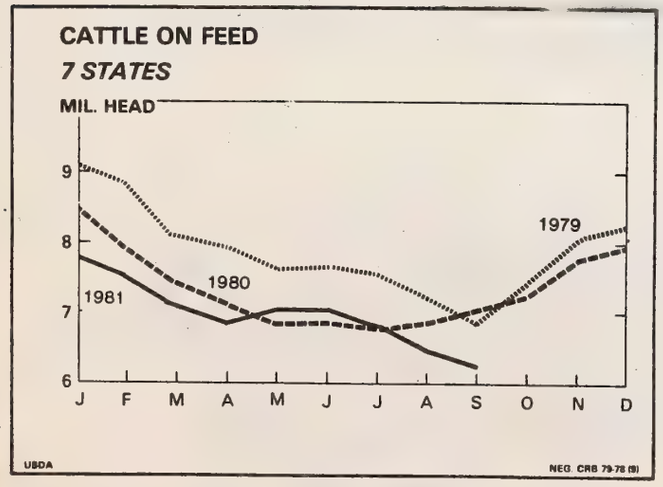
NOTABLE NUMBERS

The record dry bean crop in Montana was in 1943 with over one-half million bags produced--three times recent levels.

CATTLE ON FEED DOWN

Cattle and calves on feed September 1 for slaughter market in the 7 States preparing monthly estimates totaled 6.29 million head, down 11 percent from a year ago and off 8 percent from September 1, 1979. This is the lowest September 1 number on feed in the 7 States since 1975. MARKETINGS of fed cattle during August totaled 1.53 million, up 9 percent from 1980 but down 7 percent from 1979. PLACEMENTS of cattle and calves on feed in the 7 States were 1.42 million, down 12 percent from last year but 5 percent more than the low level of August 1979. NET PLACEMENTS of 1.36 million were down 12 percent from 1980 but 8 percent more than 1979. OTHER DISAPPEARANCE totaled 55 thousand compared with 61 thousand during August 1980 and 82 thousand 2 years ago.



HOG & PIG INVENTORY DOWN

Inventory of all hogs and pigs on September 1, 1981, in the 14 states conducting quarterly hog surveys, is estimated at 52.2 million head, 5 percent below last year and 9 percent less than September 1, 1979.

--Breeding inventory, at 7.06 million head, was 5 percent less than a year ago and 15 percent below two years earlier.

--Market hog inventory, at 45.1 million head, was 6 percent less than a year ago, and 8 percent below September 1, 1979.

Estimates for the 14 Quarterly States account for about 86 percent of the U.S. total hog and pig inventory.

PIG CROP (June-August 1981)--The June-August 1981 pig crop in the 14 states totaled 20.2 million head, 1 percent fewer than in 1980 and 11 percent below 1979. There were 2.74 million sows that farrowed during June-August, a decrease of 4 percent from a year ago and a reduction of 13 percent from the same period two years ago. Sows farrowing averaged 7.37 pigs per litter with 7.18 a year earlier and 7.16 two years ago.

FARROWING INTENTIONS--Hog producers in the 14 quarterly states intent to farrow 2.73 million sows during September-November, 6 percent fewer than during the comparable period in 1980 and 10 percent less than two years earlier. Farrowing intentions for the December 1981-February 1982 period are 2.40 million sows, 1 percent less than the same period a year earlier and 12 percent below two years ago.

AUGUST LIVESTOCK SLAUGHTER

Montana Slaughter plants produced 28 percent less red meat during August than the same month a year ago. Total production at 11.1 million pounds compares with 15.3 million pounds in August 1980 and 13.4 million pounds in July 1981. The January-August red meat production is 10 percent below the same period last year.

The August cattlekill was 8,200 head--down 41 percent from August 1980. The hogkill at 35,300 was down 12 percent from a year ago.

Commercial red meat production for the United States during August 1981 totaled 3.04 billion pounds, up 1 percent from August 1980. January-August red meat production, at 25.4 billion pounds, was virtually the same as the corresponding period in 1980. The 1981 accumulated production changes from the 1980 period by individual components were: Beef up 4 percent; Veal up 9 percent; Pork down 5 percent; Lamb and Mutton up 4 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for August included 21 weekdays and 5 Saturdays, the same as August 1980.

MONTANA EGG PRODUCTION DOWN

Montana's laying flocks produced 43 million eggs during the June-August quarter--down 9 percent from the same period a year ago. The average number of layers on hand during the quarter at 773,000 was up 2 percent from the same quarter a year ago.

The Nation's laying flocks produced 17,081 million eggs during the June-August quarter--up slightly from last year. The number of layers during the quarter averaged 280,688 million--down 1 percent from the same quarter last year.

OCTOBER 16 IS WORLD FOOD DAY

The subject of food and world hunger is something to think about on Friday, October 16. That day marks the first annual World Food Dav. The occasion was established by a resolution approved by the 147 member nations--including the United States--of the Food and Agriculture Organization (FAO) of the United Nations.

Despite the efforts of the United States and other developed countries hunger persists in the world. The FAO estimates that one out of nine people in the world, primarily in the developing countries, do not have enough to eat. The purpose of World Food Day is to call public attention to the existence of world hunger, and to urge public participation in efforts to overcome it. To achieve that objective, USDA has been taking action to ensure public awareness of World Food Day.

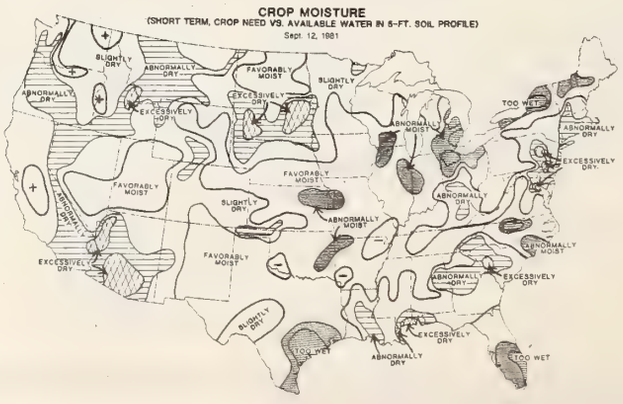
Some of the events to gain public awareness include:

--A special cancellation stamp on mail leaving New York, Chicago, and Los Angeles carrying the message "WORLD FOOD DAY, USA, October 16"

--A leaflet entitled, "Can We End World Hunger?"

--Public service television and radio announcements by Secretary Block promoting World Food Day

--Information packets for distribution to USDA field employees and others asking for world food information.



BREEDING LINE 1 HEREFORDS

The place was the annual cattle sale held at ARS's Livestock and Range Research Station, Miles City, Montana. There a 3-year-old Line 1 Hereford bull sold for $160,000--the highest price ever paid for a single animal in the history of the sale.

In all, 63 bulls of various lines were sold for about $353,000 to buyers from throughout the United States and Canada. Money received from the sale is used for the station's operations.

The sale price of Line 1 Herefords averaged $10,565 per head, more than five times the $1,911 average price brought in by all other lines of Herefords.

The Line 1 program was first established at the Miles City Station in 1934 and is one of the longest continuing beef cattle linebreeding programs in the United States. The animals have been maintained as a closed herd with no introduction of bulls or cows from other herds.

Line 1 Herefords have developed into sound Hereford cattle with good conformation and meat quality and a fast growth rate. Weaning weight and yearling weight are increasing by 22 and 35 pounds, respectively, per generation (about every 4 years); This is the most rapid and consistent gain in average weaning and yearling weight of any of the Hereford varieties.

Despite coming into industry prominence only within the past decade, Line 1 Herefords already command the Nation's highest average sale price for breeder bulls. Currently, almost half of the registered Hereford breeders in the country have cattle from or descended from the Miles City Line 1 herd, even though the herd has never numbered over 150 calving cows.

Animal physiologist Robert A. Bellows is the current research leader at the Station. His address is ARS Livestock and Range Research Station, Route 1, Box 3, Miles City, MT 59301. (By Lynn Yarris, ARS, Oakland, CA.)

TAX RELIEF

The new Economic Recovery Tax Act of 1981 has many implications for farmers. You can now depreciate all farm cars and light trucks in 3 years, equipment in 5 years, and buildings in 15 years. The new law also gradually lowers estate taxes. For 1982, estates up to $225,000 will be tax-exempt. By 1987, estates up to $600,000 will not be taxed. As of January 1, 1982, estates or gifts of any size, willed or given to your spouse, are tax-free.

WORLD CROP PRODUCTION TO EXCEED USE

Prospective 1981/82 global grain supplies are still projected aobut 2 percent above 1980/81. Production prospects changed little during August as the forecast larger U.S. crop nearly offset indicated reductions for the USSR and Europe. The U.S. grain crop is expected to rise 20 percent over last year's drought-reduced level, while production in other countries is likely to increase less than 1 percent, primarily due to another poor Soviet harvest. World use is expected to expand with a high level of feed use and continued expansion in food requirements, but the use gain is not expected to match the production expansion. Projected global stocks of around 191 million tons would be up from the carry-in level of 172 million.

The prospective 1981/82 world supply-use balance for coarse grains has further eased, primarily due to improved yield prospects for U.S. corn. World wheat supplies edged down slightly, although they remain at a record level and exceed prospective 1981/82 use.

Global 1981/82 soybean supply prospects are up from a month ago and around 8 percent above 1980/81, primarily due to improved U.S. yields and a crop indicated 15 percent above 1980. Larger supplies and lower prices are expected to mean an expanded soybean crush and larger product use during 1981/82. Still, prospective production is well above estimated market needs. Projected U.S. soybean stocks of 430 million bushels next September 1 are up one-fourth from beginning stocks.

Prospective world cotton supplies in 1981/82 further increased in August, as crop prospects improved in the United States and China. The projected supply is 5 percent above a year ago, as the projected 8-percent-larger crop more than offsets 2-percent-smaller beginning stocks. World use is expected to benefit from larger supplies, although sluggish economic actibity in several importing countries may hold the consumption gain to nearly 3 percent. Most of the projected increase in world stocks will occur in the United States where the expected carryover of 5 million bales next August 1 would be sharply above the very low beginning stocks.

WHEAT EXPORTS UP

After slumping in May, wheat exports have rebounded sharply--led by shipments to China and increased exports to Northern Africa, Western Asia and Latin America. Exports through July of wheat and flour amounted to 33.8 million tons--16 percent more than a year ago. New crop wheat (and wheat flour) should be moving out even more heavily during August and September. Anticipated purchases by China, the USSR, India, Turkey and Northern Africa have helped boost the forecast of fiscal 1982 wheat exports by 5 to 7 million tons.

GRAIN STORAGE

Despite the record wheat and near-record corn crops now forecast, storage space is still sufficient for this year's grain harvest. Nationwide, only 75 percent of all grain storage space is estimated to be used in November. In early August--with 86 percent of the winter wheat crop harvested--only 54 percent of commercial storage space was filled. At the peak of the fall harvest, however, producers in the Midwest should anticipate delays in moving grain into local elevators for storage or reshipment. Rail and barge capacity also appears to be more than adequate for the fall harvest.

PASTURE AND RANGE GOOD

Condition of pastures and ranges over the state is slightly above average for this time of year. Conditions are poorest in the north central, northeast and southeastern areas of the state. Winter grazing prospects are reported adequate to excellent except in the drier areas of eastern Montana. Stockwater supplies are generally below normal for this time of year.

STATE	69	66	81

RECORD ALL WHEAT CROP IS FORECAST

Montana's all wheat production for 1981 is forecast at 174.3 million bushels based upon September 1 conditions. This is slightly higher than last month's estimate. If realized this would surpass the 1976 record all wheat crop of 167.3 million bushels. Harvest of winter wheat was about complete, and other small grains were about 65 percent harvested the first of the month, so most producers had a good opportunity to evaluate their crop output.

Winter wheat production is estimated at 90.0 million bushels. This is 3 percent above the August 1 forecast and would be the third largest Montana winter wheat crop. The largest was in 1975 and second largest in 1976. Hard red spring remains unchanged from August 1 at 71.5 million bushels. If realized it would surpass the previous record of 60.2 million bushels set in 1976. Durum wheat production at 12.8 million bushels would be the second largest crop--the record was the 1956 crop of 18.1 million.

The Montana barley crop is expected to reach 57.2 million bushels, unchanged from the August 1 forecast, and 30 percent more than a year ago. Oats production is 5.5 million bushels is also unchanged from August 1 and 71 percent above 1980. Sugarbeet production is expected to be 2 percent below a year ago at 860,000 tons.

FARM PRICES DOWN

The August Index of Prices Received by Montana farmers and ranchers for all Farm Products at 151 (1977=100) was down 1 percent from the revised July index. The All Crops Index at 149 was 6 percent below July and 9 percent below a year ago. The Livestock and Products Index at 152 was 4 percent above July and 14 percent below August 1980.

In comparing August prices with July prices decreases were noted for all Crop Items except Durum which was unchanged. The only Livestock Items to increase were Cows, Beef Cattle and Hogs.

Nationally, the August Index of Prices Received by Farmers decreased 3 points (2.1 percent) from July to 138 percent of its January-December 1977 average. Contributing most to the decrease since July were lower prices for corn, cattle, soybeans, peanuts, dry edible beans and cotton. Higher prices for apples, oranges, lemons, milk, tobacco and calves were partially offsetting. The index was 3 points (2.1 percent) below a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates for August was 151 percent of its 1977 base, up 1 point (.7 percent) from July. Higher prices for replacement livestock and family living items more than offset the price declines for feed. Compared to a year earlier, the index was 11 points (7.9 percent) higher.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 560,000 pounds of creamed cottage cheese during July--14 percent more than July 1980. Ice cream production at 213,000 gallons was 4 percent below a year ago. Butter production totaled 130,000 pounds, up 16 percent.

HIGHLIGHTS:

- Red Meat Production
- Cattle Herd Expansion
- Crop Production Costs
- Barley Varieties
- Farm Production Expenditures
- U.S. Feed Grain Crops Outlook Improves

CATTLE EXPANSION SLOWS . . .

BUT CONTINUES

The rate of increase in the cattle herd buildup has moderated, but expansion continues. The July 1 inventory indicated that total cattle and feef cow numbers each rose 2 percent from a year ago. Beef replacement heifers saved for possible herd expansion were 7 percent above last year and point to continued herd rebuilding. Improved grazing and forage prospects are encouraging producers to continue the buildup in spite of feeder cattle selling at prices lower than a year ago. Much of the expansion will likely continue throughout the country on farms and ranches where the cattle enterprise is an important or only source of income. These operations will expand to more fully use forage resources. However, there appears to be little or no incentive to encourage new operations or to deter the shift of cropland pasture back into crop production.

Feeder cattle supplies have tightened but remain adequate for increased feedlot placements and/or continued large nonfed slaughter. The 1981 calf crop is expected to be only 1 percent larger than last year. Feeder cattle supplies outside feedlots on July 1 were also 1 percent above a year ago. Feeder calf supplies were 2 percent bigger, while the yearling supply declined 3 percent.

JULY LIVESTOCK SLAUGHTER

Montana slaughter plants produced 12 percent less red meat during July than the same month a year ago. Total production at 13.4 million pounds compares with 15.2 million pounds in July 1980 and 14.5 million pounds in June 1981. The January-July red meat production is 8 percent below the same period last year.

Commercial red meat production for the United States in July 1981 totaled 3.04 billion pounds (1.38 million metric tons), down 1 percent from July 1980. January-July red meat production, at 22.3 billion pounds (10.1 million metric tons), was essentially unchanged from last year. The 1981 accumulated production changes by individual components were: Beef, up 4 percent; Veal, up 9 percent; Pork, down 6 percent; Lamb and Mutton, up 3 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Crop Production Costs: This Year's Prospects

Rising production costs continue to plague farmers. Costs per acre this year are projected to increase 14 to 19 percent after last year's 15.4 percent per acre jump in expenses—excluding land costs.

But some relief may be in sight. Input prices—especially fuel—should rise less this year than last, especially in light of OPEC's recent agreement to freeze oil prices through the end of the year.

Last year, fuel prices led the surge in production costs with a 38-percent rise over 1979 levels. Even before the OPEC announcement, USDA economists expected a more moderate 22 to 26 percent rise in fuel prices in 1981.

Since fertilizer and chemical prices are greatly influenced by energy costs, these, too, should rise more slowly. Fertilizer prices are expected to rise 12 to 14 percent this year, after a 24-percent jump during 1980. Farm motor supplies, machinery, and interest costs should also rise at a slower rate.

On the other hand, costs of several inputs are expected to rise more this year than last: wages, automobiles and trucks, and seed.

Per Unit Costs

If the overall rate of per acre cost increases for crops shows little if any improvement over 1980, farmers may fare much better by a different yardstick: per unit production costs.

With last summer's drought cutting sharply into yields, 1981 will almost certainly show much smaller increases in costs per unit of production, according to USDA economist Robert E. Olson.

Many farmers would be quick to say that anything would be an improvement over last year, when falling yields and rising costs in most areas meant a staggering jump in per unit costs. Yields declined for all major crops.

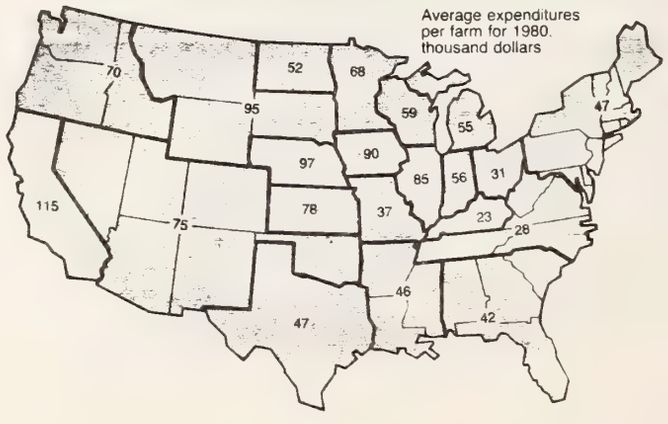
Of course, as Olson points out, these 1980 declines were from 1979 levels—a year that saw record or above average yields for most major crops.

Even so, the effect of the drought on per unit production costs was disastrous for many farmers, since the fast-rising input prices were absorbed by small total output. Per unit costs rose an average of more than 40 percent for all crops and 89 percent for peanuts—a crop that was also hard-hit by fungus.

Yields at pre-drought trends this year, Olson says, would mean only modest nonland production cost increases for most crops: corn and oats, 1 percent per bushel; barley, 6 percent per bushel; wheat, 14 percent per bushel; and rice, 11 percent per cwt. Per unit costs should actually decline for sorghum, soybeans, sunflower, flax, peanuts, and cotton.

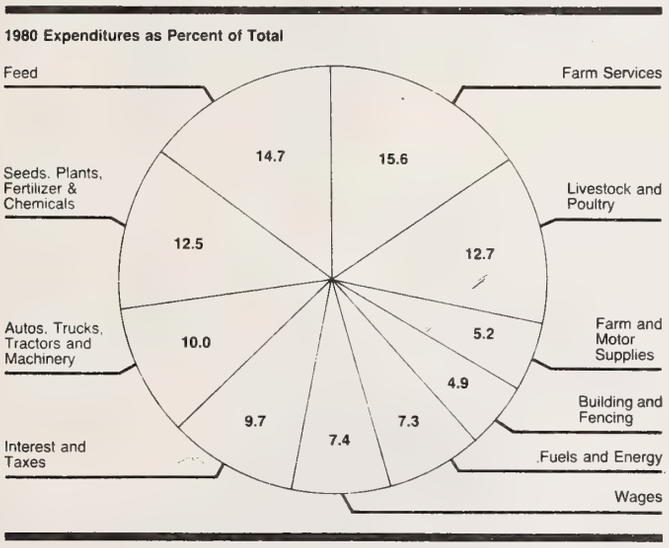
Of course, the figures for 1980 are national averages. Individual farmers—in each region, state, and county—did better or worse. In fact, some regions—especially those that missed the brunt of the drought—actually increased their production. For example, barley yields increased substantially in the northwest, southwest, and northeast.

Projections showing very moderate per unit production cost increases are also subject to wide variation from area to area and farm to farm. Also, with much of the summer still ahead, no one can rule out another drought or other natural disaster which could again greatly reduce yields.

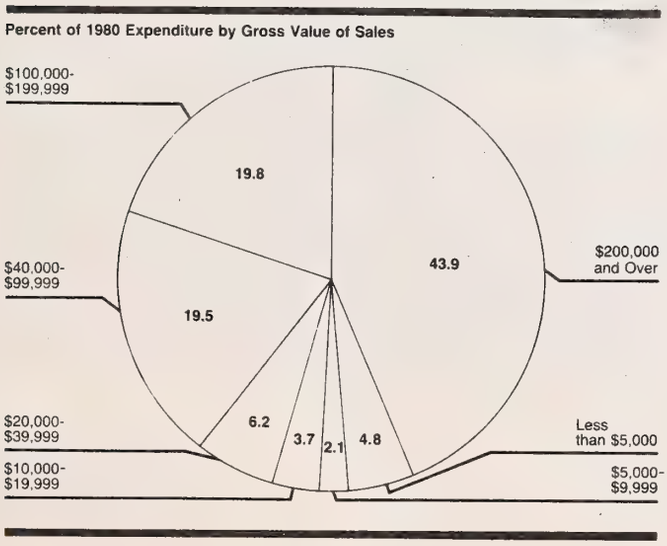


FARM PRODUCTION EXPENDITURES

Farm production expenditures during 1980 totaled $136.6 billion, up just 1 percent from the $135.1 billion level of 1979. The average expenditure per farm declined from $58,049 in 1979 to $56,392 in 1980. Farm Services at $21.3 billion was the largest expenditure group, accounting for nearly 16 percent of the total. Feed purchases totaled $20.1 billion or 15 percent of the total; livestock and poultry accounted for $17.4 billion or 13 percent; interest expense, $10.6 billion or 8 percent; followed by fertilizer and soil conditioners, $10.2 billion or 7 percent.

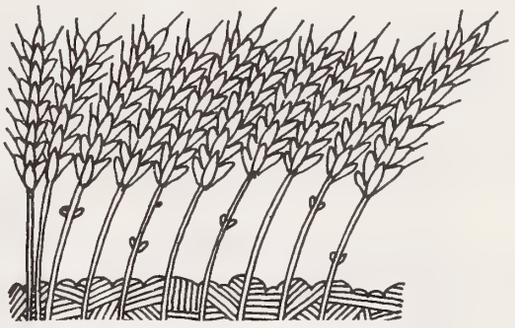


Those farms reporting gross sales of at least $200,000 accounted for less than 7 percent of all farms, but 44 percent of total farm expenditures. Farms with gross sales of $100,000 to $199,999 totaled 10 percent of all farms with 20 percent of all expenses. Farms with sales of $40,000 to $99,999 accounted for 18 percent of all farms and had 19 percent of expenditures. Farms with sales less than $5,000 totaled 32 percent but had only 5 percent of the expenditures.



SOVIET CROP OUTLOOK WORSENS

Continued hot, dry weather in July and a marked reduction in estimated final grain area are responsible for a lower projected 1981 Soviet grain production estimate, down to 185 million metric tons from last month's 200 million. This is the third consecutive year of a poor Soviet grain harvest. The 1981 Soviet grain target was 236 million tons. Wheat production is now placed at 95 million tons against 100 million estimated last month. A larger reduction occurred in projected coarse grain output which fell to 80 million tons from July's projected 90 million. The estimate for miscellaneous grains and pulses remains unchanged at 10 million tons. The preliminary area figures in the Soviet six-month plan fulfillment report show a significant decline in grain area from previous years. Therefore, the estimate for final grain area has been reduced from 126.5 million hectares to 124 million, the lowest since 1972. Wheat area is still projected at 61 million hectares while estimated coarse grain area dropped sharply to 55 million from last month's figure of 58 million. The area for miscellaneous grains and pulses of 8 million hectares is up by 500,000 hectares.



U.S. FEED GRAIN CROPS PROSPECTS

U.S. feed grain supplies will rise next season because of improved prospects for the fall harvest and an upward revision in this year's projected ending stocks. The larger supplies, plus indications of only a modest growth in use, suggest that stocks on October 1, 1982 will exceed this year's level. The projected 1981/82 carryover for feed grains would represent 18 percent of total use, compared with 15 percent this year and an average stocks-to-use ratio of 22 percent for the 1977-79 crops. So, season-average prices for feed grains will likely fall from this year's record.

Based on conditions as of August 1, U.S. feed grain production in 1981 is expected to total 236 million metric tons, up 19 percent from last year's drought-reduced crop but 1 percent less than the 1979 record. Corn production, which normally accounts for about four-fifths of total feed grain output, is projected up 16 percent from last year and 9 percent from the July 1 forecast. Sorghum production is expected to rise 42 percent from last year, with the barley and oats crops up 35 and 14 percent, respectively.

GREETINGS FROM YOUR NEW STATE STATISTICIAN.....

About a month ago I moved to Montana to serve as your State Statistician. I appreciate the opportunities and challenges this job represents.

We will do our best to provide you with the kinds of information you need to help develop your production and marketing plans. In these times of high interest rates, high inflation and prices that just don't keep up, we feel this information is vital to all in agriculture.

Fewer and fewer people have direct farm or ranch experience and don't understand the costs and risks involved in agriculture. Fewer than 3 million farm families now produce enough to feed and clothe our 225 million Americans--plus exports. One farm worker in the U.S. supplies food and fiber for 68 people. It's this kind of productivity that allows us to provide over 40 percent of the world's wheat exports and over 70 percent of coarse grains.

Information on production and stocks are essential to maintain and expand our export business and still maintain an adequate domestic supply.

Our purpose is to provide you with accurate, unbiased information. This information is often already available to many grain and livestock buyers through their own sources. To maintain a high level of accuracy, we need the cooperation of each of you that are sampled and receive our questionnaires. Please fill them out, include comments, and we in turn will provide you with the best information available on Montana and U.S. agriculture

Lyle H. Pratt

Lyle H. Pratt,
State Statistician

PASTURE AND RANGE

Pastures and ranges are still above average for this time of year. Range feed is good over most of the State. The grass is very thin and somewhat coarse in the northeast, and scattered areas of the east. The critical element this year as last year is stockwater supplies. Supplies are especially critical in the eastern portions of the north central and northeastern areas of the State.

MONTANA PASTURE AND RANGE FEED CONDITION AUGUST 1
by District as a percent of Normal

DISTRICT	1979	1980	1981
Northwest	55	99	101
Northcentral	66	58	88
Northeast	73	21	75
Central	68	79	96
Southwest	69	95	97
Southcentral	72	77	98
Southeast	65	27	79
STATE	67	63	90

News on the farm front . . . July 1 conditions pointed to a huge wheat crop of 2.81 billion bushels, up 19% from 1980's 2.37 billion. Expected U.S. average yield: 34.8 bushels per acre, up from 33.4. On the plus side, world demand will rise, and U.S. farmers will use a lot more wheat in feed rations. But we're not the only ones sitting on a record crop--so is the rest of the world. Thus, U.S. prices may not match last season's $3.96. Wheat prices have recently been running below the $3.81 target price, raising a possibility of deficiency payments.

Hot, dry weather is cutting into Soviet crop prospects. This may be their third poor harvest in a row if weather doesn't improve. USDA now estimates their grain crop at 200 million tons, well below their 236-million-ton target. Add a new trade agreement with Brazil to those with Argentina and Canada, and it seems we're at the bottom of their shopping list. But the Soviets aren't likely to find all the grain they need without eventually coming to the U.S.

MONTANA CROP PRODUCTION FORECAST

The 1981 Montana wheat crop is expected to be 171.2 million bushels--down slightly from last month's projection--primarily due to hot weather during the first week of July, according to the Montana Crop and Livestock Reporting Service. Winter, hard red spring and durum wheat production should all be much higher than the 1980 drought stricken crop based on August 1 conditions. If realized, this would be a record wheat crop surpassing the previous high in 1976.

The winter wheat production forecast remains unchanged at 87.4 million bushels. This is 59 percent larger than the 1980 crop. Hard red spring, down 4 percent from the July 1 forecast, is at 71.4 million bushels. This is still 25 percent more than 1980. Durum wheat production at 12.4 million bushels is 63 percent above last year's crop.

The Montana barley crop is expected to produce 57.2 million bushels, 30 percent above the 1980 level, but 4 percent below the July 1 estimate. Oats production at 5.5 million bushels is up 71 percent from last year.

Hay production for 1981 is forecast at 4.29 million tons which is 3 percent above the 1980 harvest. The effects of last year's drought are still limiting hay yields this year. Alfalfa hay accounts for 2.94 million tons, up 4 percent, while other hay makes up the remaining 1.35 million tons, unchanged from last year. Sugarbeet production, at 860,000 tons, is 2 percent below last year's crop. Dry bean harvest is expected to produce 176,000 hundredweight, the same as in 1980.

JULY FARM PRICES

The July Index of Prices Received by Montana farmers and ranchers for all farm products at 158 (1977=100) was down 2 percent from the revised June Index. The All Crops Index at 167 was 4 percent below June, but slightly above a year ago. The Livestock and Products Index at 149 was 2 percent below June, and 7 percent below July 1980.

In comparing July prices with June prices, decreases were noted for most Crop and Livestock items.

Nationally, the June Index of Prices Received by Farmers decreased 1 point (.7 percent) from June to 141 percent of its January-December 1977 average. Contributing most to the decrease since June were lower prices for cattle, oranges, wheat, barley and hay. Higher prices for hogs, tobacco, potatoes, broilers and lettuce were partially offsetting. The index was 6 points (4.4 percent) above a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates for July was unchanged from June at 151 percent of its 1977 base. Lower prices for many feed items, replacement cattle and hogs were offset by higher prices for motor supplies and family living items. Compared to a year earlier, the index was 12 points (8.6 percent) higher.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 110,000 gallons of ice cream during June--1 percent more than June 1980. Creamed cottage cheese at 508,000 pounds was up 13 percent from last year. Butter production at 141,000 pounds was 18 percent greater than June 1980.

HIGHLIGHTS IN THIS ISSUE

July 1 Cattle Inventory Up
Fewer Cattle On Feed
Milk Production Higher
Lamb Crop and Wool Production Up
Red Meat Production Down
Home Grown Oil

NOTABLE NUMBERS

Asia received 29 percent of the U.S. corn exports in the 1979-80 marketing year, followed closely by 28 percent to Western Europe and 17 percent to the U.S.S.R.

NATIONAL CATTLE HERD CONTINUES UP

Nationally, the July 1 cattle inventory was 125 million head, 2 percent above July 1 a year ago, and 6 percent above July 1, 1979. All classes were up except other herd replacement heifers and steers 500 pounds and over.

The 1981 calf crop is expected to be 45.6 million head--1 percent more than 1980.

MONTANA CATTLE HERD LARGER

Montana cattlemen continue to expand their herds as the annual mid-year survey of producers indicates cattle numbers are up 9 percent from last year.

Beef cow numbers were up 10 percent and beef replacement heifers were up 15 percent from a year ago. Steers over 500 pounds were down 11 percent.

The 1981 calf crop is estimated at 1.6 million, up 5 percent from last year. This includes all calves born during the January 1 - July 1 period, plus calves expected to be born before December 31.

MONTANA RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 5 percent less red meat during June than the same month a year ago. Total production at 14.5 million pounds compares with 15.2 million pounds in June 1980 and 13.7 million pounds in May 1981. The January - June red meat production is 7 percent below the same period last year.

Commercial red meat production for the United States in June 1981, totaled 3.11 billion pounds, up 1 percent from June 1980. January - June red meat production, at 19.3 billion pounds was up less than 1 percent from last year. The 1981 accumulated production changes by individual components were: Beef, up 5 percent; Veal, up 9 percent; Pork, down 6 percent; Lamb and Mutton, up 3 percent.

Kill days for June included 22 weekdays and 4 Saturdays, compared with 21 weekdays and 4 Saturdays for June 1980.

MILK PRODUCTION HIGHER

Montana's dairy herds produced 85 million pounds of milk during the April - June quarter--10 percent more than the same quarter a year ago. The number of cows in the State's herd during the quarter averaged 29,000--up 1,000 from last year.

Compared with the previous quarter (January - April 1981) milk production in the State rose 9 percent or 7 million pounds.

1/ Includes dry cows, excludes heifers not yet fresh. 2/ Excludes milk sucked by calves.

NEW U.S. WHEAT CROP TO REACH ALLTIME HIGH

The 1981/82 U.S. wheat outlook is dominated by another record crop. The July 1 forecast places 1981's production at 2.81 billion bushels, almost a fifth larger than last year's record. This increase is mainly the result of the largest area ever planted to wheat--88.8 million acres--plus a sharp increase in spring wheat yields from last year's drought-reduced levels.

Early prospects for the 1981/82 world wheat crop also indicate that production could be record size--around 465 million tons. Most crops in the Northern Hemisphere are expected to be larger than a year ago, with the biggest increases in the United States and Canada. The Soviet Union's crop may be up only slightly from last year, so Soviet import demand is likely to remain strong. This factor, combined with strong demand from other importing countries, notably China and India, suggests that global wheat trade may top last year's record by 7 percent or more.

CATTLE ON FEED--JULY 1, 1981

Cattle and calves on feed in Montana feedlots on July 1, 1981 totaled 40,000 head--18 percent less than last July. Steers on feed at 21,000 head were down 8,000 head from a year earlier, and heifers at 19,000 head were unchanged. About 83 percent of all steers and heifers on feed weighed 700 pounds or more, and 33 percent weighed 900 pounds or more.

Marketings at 15,000 head were down 21 percent from last July. Other disappearance (mainly movement to other feedlots and returning cattle to pasture) at 11,000 head was up 9,000 head from last year. Placements in lots during the April - June quarter totaled 27,000 head--up 29 percent from the same period a year ago.

Montana feeders expect to market 30,000 head of fat cattle during the July - September period, 30 percent more than the same period in 1980.

Cattle and calves on feed July 1, 1981, for slaughter market in the 23 major feeding states totaled 9.57 million head, 1 percent below a year earlier and 7 percent less than 2 years ago. This is the smallest July 1 number on feed since 1975. For both steers and heifers, lighter weight groups are considerably lower than last year, while the heavier weight groups are generally showing increased numbers on feed.

USSR GRAIN SITUATION AND OUTLOOK

The Soviet Union's 1981/82 domestic grain supply outlook has tightened from a month ago as continued dry weather and a smaller estimated grain area have reduced crop prospects. Even if grain imports rise to 38 million tons in 1981/82, 3 million more than forecast last month, the Soviets may have to delay adding appreciably to badly depleted stocks.

The estimate of the 1981/82 USSR grain crop has been placed at 200 million tons, down 10 million from last month's estimate. This compares with last season's poor outturn of 189 million tons and the official Soviet target of 236 million. The estimate of a record level of imports is based on the expectation that domestic utilization will recover in 1981/82, while the Soviets begin to rebuild stocks.

LAMB CROP AND WOOL PRODUCTION UP

Montana's 1981 lamb crop is up nearly 8 percent from last year at 420,000 head. Ewes on hand January 1 were up 5 percent. Therefore, the 8 percent larger lamb crop resulted from a combination of more bred ewes and a higher lambing percent. Mild winter weather probably helped save lambs.

Montana's flock produced a near record average fleece weighing 10.3 pounds each. More sheep shorn and heavier fleeces pushed wool production up to 5.6 million pounds, nearly 8 percent more than a year ago.

CAN HOME GROWN OIL STRETCH YOUR DIESEL DOLLAR?

It isn't crude, but it is oil. It's diesaveg (dee'-za-vej), a combination of diesel fuel and vegetable oil. And according to agricultural researchers, diesaveg is coming on strong as an alternative to conventional diesel fuel.

"By the end of this decade, diesaveg could become a fairly common farm fuel," says John Baldwin, professor of agricultural engineering at Louisiana State University. "With the right portable equipment to crush and filter the oil, farm energy needs could be met, at least partially, from crops."

Alternative fuels, primarily gasohol, have gotten a lot of attention in recent years. But because of its alcohol base, gasohol can't be used in the diesel engines of most farm machinery. In 1980, farmers used 3.3 billion gallons of diesel fuel just to produce U.S. crops and livestock. Cost is the biggest drawback to diesaveg. The price of a gallon of sunflower oil ($2.24) or soybean oil ($1.92) looks steep compared with diesel fuel at around $1.20. But this may not always be the case.

"Trends, especially during the 1970's, point in a different direction," says USDA economist Ed Fryar. "The 5 years before the 1973 oil embargo, diesel fuel prices increased an average of 4.5 percent a year. But for the next 8 years, price increases averaged around 25 percent annually."

If these trends were to continue, prices for both diesaveg and diesel fuel would be about equal by the middle to late 1980's. However, energy analysts say that diesel fuel prices in the next 10 years will probably not rise as rapidly relative to vegetable oil. If so, diesaveg might not be an economical substitute for diesel fuel until, perhaps, late this century.

"If the two reach the same price, the cost of diesel fuel will serve as a floor price for vegetable oil," Frayer says. This means that if the price of vegetable oil starts to fall below the price of diesel fuel, more farmers will buy vegetable oil for their tractors, forcing vegetable oil prices back up to those for diesel fuel.

Does diesaveg have enough potential power to compete with conventional diesel fuel? According to Fryar, the answer is yes. BTU content and dynamometer tests prove him out.

Gallon for gallon, the potential power of a diesaveg mixture of 75 percent diesel fuel and 25 percent vegetable oil is only 1 to 2 percent less than conventional diesel fuel. The BTU content of #2 diesel fuel--commonly used to power farm equipment--is 140,000 per gallon. Diesaveg can vary between 137,000 and 138,000 BTU's. Ethanol (or ethyl alcohol), gasohol's base, comes in third at 85,000 BTU's per gallon.

Economics and Statistics Service — USDA and Montana Department of Agriculture — ISSUED TWICE MONTHLY

HIGHLIGHTS IN THIS ISSUE

Pasture & Range Condition Good
Manufactured Dairy Production
Mink Production Up
Agricultural Prices
State and U.S. Crop Production

NOTABLE NUMBERS

The record production of oats in Montana occured in 1915 with 25 million bushels--followed by the 1970 crop with nearly 23 million bushels.

PROJECTED 1981 SOVIET GRAIN CROP REDUCED

Hot, dry weather has reduced yield prospects in two regions of the Soviet grain belt. This, along with a reduction in sown area, is responsible for lowering the total grain-crop estimate to 200 million metric tons from 210 million in June. The 200 million ton projection assumes normal weather for the balance of the crop season. Adverse weather conditions either during the remaining weeks of the growing season or throughout the harvest could reduce the current estimate by as much as 20 million tons while favorable weather could increase it by 10 million. Estimated wheat production now stands at about 100 million tons--a three million ton reduction from last month--and coarse grains, 90 million--about 7 million below the June projection. The estimate for miscellaneous grains and pulses remains unchanged at 10 million tons.

MANUFACTURED DAIRY PRODUCTION

Montana dairy plants made 147,000 gallons of ice cream during May--19 percent less than May 1980. Production of creamed cottage cheese at 474,000 pounds was up 3 percent from last year, but down 8 percent from last month. Butter made at 149,000 pounds was down 2 percent from a year earlier and 11 percent below last month. American cheese production totaled 273,000 pounds, 8 percent less than last year, but 53 percent above last month.

PASTURE AND RANGES GOOD TO EXCELLENT

Pasture and range feed prospects are reported excellent in the western half and south central part of the State. Condition in the north central part of the State and the eastern third is generally reported good. Hot, dry winds and limited moisture could deteriorate pasture and range conditions very rapidly in the eastern half of the State.

MONTANA PASTURE & RANGE FEED CONDITION JULY 1

POTENTIAL FOR RECORD WHEAT CROP

The 1981 Montana all wheat crop is expected to total a record high of 174.0 million bushels--slightly above the previous record in 1975 and 45 percent above the 1980 production of 119.8 million bushels.

The July 1 condition of winter, durum and hard spring wheat indicate production should all be much higher than the 1980 drought affected crop. Timely precipitation last fall in the eastern drought areas and late May and June precipitation Statewide has brought about the potential for the State's third largest winter wheat crop.

Winter wheat production at 87.4 million bushels is 59 percent above last year and 13 percent higher than the June 1 forecast. Durum wheat at 12.4 million bushels is up 63 percent from last year and the second largest on record. This is largely a result of a 19 percent increase in harvested acres and significant precipitation in northeastern Montana during June. Production of hard spring wheat at 74.3 million bushels is up 29 percent from 1980 due to both a higher yield and an 8 percent increase in harvested acres. Seasonal rainfall will be needed to realize full crop potential.

Montana barley crop is expected to reach 59.8 million bushels--35 percent higher than 1980, due primarily to a 24 percent increase in harvested acres. Oats production at 5.5 million bushels is up 71 percent. This increase is also largely due to a 51 percent increase in harvested acres.

Sweet cherry production is forecast at 1800 tons compared with the record low 700 tons produced in 1980. Fruit set was light due to cool, wet conditions. Hay, dry bean and sugarbeet production estimates will be released August 12.

FARM PRICES WEAKEN

Montana farm prices are showing a weakness for several important commodities. The index of prices received (1967=100) at mid-June for all farm products stood at 257, down 11 points from May, but up 1 point from June a year ago.

Lower cattle prices are causing a major portion of the farm price weakness. The June livestock and products index at 224 compares with 233 a month earlier and 242 a year ago. Hog and lamb prices are the only items in the index showing significant improvement from both last month and year ago levels.

For all crops, the index at 306 compares with 318 last month and 276 last year. All wheat is lower than May levels but above June of 1980. Barley is lower than both last month and last year. Hay prices are down nearly $10 per ton from last year when the drought was pushing prices upward.

For the Nation, the June index of prices received by farmers decreased .7 percent from May. Contributing most to the decrease since May were lower prices for wheat, soybeans, corn, hay and lettuce. Higher prices for hogs, tomatoes, potatoes, broilers and turkeys were partially offsetting. The index was 11 percent above a year ago.

The index of prices paid by farmers for commodities and service, interest, taxes and farm wage rates for June was up .7 percent from May. Higher prices for farm equipment and family living items were partially offset by lower feed and fuel prices. The June index was 10 percent higher than a year earlier.

MINK PELT PRODUCTION UP

Mink pelt production in the United States in 1980 totaled 3.50 million pelts, up 3 percent from 1979. Wisconsin, the major mink State, produced 997 thousand pelts, 2 percent more than the 978 thousand pelts produced in 1979.

By color class, the number of pelts as a percent of the total U.S. production was: Standard, 36.2 percent; ranch wild, 6.5 percent; demi-buff, 19.1 percent; pastel, 17.6 percent; pearl, 5.1 percent; violet, 4.7 percent. The remaining color classes accounted for 10.8 percent.

Mink pelts sold during the 1980 crop year were valued at 123.6 million dollars. This is a decrease of 11 percent from the value of 139.5 million dollars for pelts sold during the 1979 crop year. The average price per pelt for the 1980 crop year was $35.30 compared with $41.10 a year ago.

Mink females bred to produce kits in 1981 total 1.07 million, up 4 percent from a year ago. Bred females and percent changes from a year ago for the two major color classes are: Standard, 410 thousand females bred, up 1 percent; pastel, 193 thousand, up 5 percent. Females bred in the leading States and percent changes from 1980 are: Wisconsin, 296 thousand, up 5 percent; Utah, 152 thousand, up 2 percent; and Minnesota, 137 thousand, up 2 percent.

There were 1,122 mink ranches producing pelts in 1980, up 2 percent from the 1,105 ranches a year ago. Wisconsin with 267 ranches was up 6 percent; Utah with 190 was unchanged; and Minnesota with 158 was up 5 percent.

HIGHLIGHTS IN THIS ISSUE

Montana Grain Stocks Steady
Slaughter Down
U. S. Hog Inventory Lower
Egg Production
Feed Grain Perspectives

NOTABLE NUMBERS

U. S. wheat production represents only 15 percent of world production, but accounts for 45 percent of world wheat exports.

HOG NUMBERS DROP

The June 1 inventory of hogs and pigs showed some sizeable reductions in inventory numbers, pig crop and farrowing intentions. The U.S. all hog inventory at 59.7 million head was down 8 percent from both a year earlier and 1979. It was also 7 percent lower than the December 1, 1980 inventory. This June report follows tne downtrend in the cycle which started last December.

Breeding hogs this June were down 12 percent from June 1980 and market hogs were off 8 percent. The December - May pig crop was 9 percent below the same period in 1980. Sow farrowings were 5 percent below the farrowing intentions for December - May published in December.

Nearly all the major hog states showed reductions in inventory and farrowing intentions this June. Montana hog statistics are not available separately in June.

U.S. producers intend to farrow 6.05 million sows during the June - November 1981 period down 11 percent from 1980.

Pork supplies will be further reduced in the months ahead, relieving pressure on prices and reducing supply competition to beef.

RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 10 percent less red meat during April than the same month one year ago. Total production at 13.9 million pounds compares with 15.4 million pounds in April 1980 and 13.7 million pounds in March 1981. The January-April red meat production is 6 percent below the same period last year.

Commercial red meat production for the United States in April 1981 totaled 3.30 billion pounds, down 1 percent from April 1980. January - April red meat production at 13.1 billion pounds was 2 percent more than last year. The 1981 accumulated production changes by individual components: Beef, up 5 percent; Veal, up 9 percent; Pork, down 3 percent; Lamb and Mutton, up 6 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for April included 22 weekdays and 4 Saturdays, the same as April 1980.

FEED GRAIN PERSPECTIVES

What can farmers expect now that the grain embargo has been lifted? The USSR has already purchased its limit for 1981, the last year in the 5-year agreement, so technically negotiations would have to precede any new purchases. USDA is preparing for such consultations, and options are being discussed for a possible renewed U.S.--USSR grain agreement.

Will the end of the embargo spur prices? Long-term improvement will depend on acutal sales to the USSR this year and the negotiation of a new agreement. The initial price surge in anticipation of new sales has been weaker than expected, possibly because the grain markets had already been adjusting, while recent rain improved crop prospects and dampened prices. At the same time, importers seem to be waiting for lower harvest-time prices.

Are the Soviets still willing buyers? They'll need more grain this year--perhaps up to 5 million tons before fall--and the U.S. could be one of the sellers. However, the USSR diversified its supply sources during the sales suspension and probably won't rely as heavily on the U.S. for its grain imports.

The U.S. has the supplies...especially wheat. Stocks are ample, and USDA now forecasts a record winter wheat crop this year of 2.08 billion bushels. Corn supplies, too, could be enough to meet new demand from the Soviets. This year's plantings are about the same as last year and yields should be up if the weather permits. April 1 corn stocks of 101 million metric tons were also higher than had been expected after the drought last summer, though still 18 percent below last year.

Reduced feed usage helped keep supplies up. Livestock and poultry producers cut down on feed use this year as high feed costs squeezed returns and a mild winter kept up rates of gain, reducing the need for feed. Producers are expected to use about 4.1 billion bushels of corn in 1980/81--250 million fewer than estimated earlier.

Prices could be unstable next year if the trends that kept markets volatile continue. The high interest rates that have made producers reluctant to hold crop and livestock inventories should be here till late in 1981. If the dollar stays strong, that could lower exports as importing countries look elsewhere for less expensive goods. Foreign crops--especially in South America--look larger than had been expected. That's not a good sign for prices.

Source: FARMLINE/June 1981

JUNE 1, 1981 GRAIN STOCKS

Wheat stored on Montana farms and in mills and elevators June 1, 1981 totaled 74.6 million bushels, about the same as one year ago.

Wheat disappearance since April 1 was 19.7 million bushels, down 9 percent from a year ago. On farm storages accounted for 61.1 million bushels or 82 percent of the total wheat stocks.

Winter wheat stored in the State at 33.8 million bushels was down 22 percent from last year. However, all spring wheat at 40.8 was 30 percent above one year ago. The durum portion at 5.4 million bushels was 15 percent above last year. Barley stocks in all positions at 7.5 million bushels were 31 percent below last year, and oats in storage at 2.3 million bushels were down 18 percent.

Nationally, old crop wheat stored in all positions on June 1, 1981 amounted to 991 million bushels--10 percent greater than the 902 million bushels on hand a year earlier and 7 percent more than two years ago. Farm stocks totaled 414 million bushels, 42 percent of the total. In comparison, farm stocks last June 1 were 377 million bushels which was also 42 percent of the total. June 1, 1981 off-farm stocks totaled 577 million bushels, 10 percent more than last year's 525 million bushels. April-May disappearance this year was 338 million bushels compared with 323 million bushels during the comparable period last year. June 1980-May 1981 disappearance totaled 2.28 billion bushels, 6 percent more than the 2.16 billion bushels disappearance for a year earlier. Of the total June 1, 1981 old crop wheat stocks, 548 million bushels were under Government control. This total includes 189 million bushels owned by the Commodity Credit Corporation and 360 million bushels held in the farmer-owned reserve.

NOTE FROM STATE STATISTICIAN

I will be retiring July 10 after 32 years in this statistical work. It has been an interesting career, providing a necessary service to the Nation's agriculture.

I have served in Montana, Colorado, Washington, D.C., Oregon and back to Montana in 1970. Each assignment presented a new challenge and different field--cattle statistics in Washington, D.C., the varied agriculture of the Pacific Northwest and returning to my home state and viewing our agriculture in a new perspective. Agriculture is the major Montana enterprise and should continue very important in the future.

I have some new interests to pursue during retirement, but I will carry fond recollections of this work and my friends in agriculture.

Lyle H. Pratt will replace me as State Statistician. He is a native of Wisconsin and a graduate of the University of Wisconsin. He served in the military and worked in our Wisconsin office, Washington, D.C., and has served as Assistant State Statistician of the Minnesota office since 1976. He has an excellent 20 year background in our statistical work and will provide imaginative leadership to the fine Montana office staff. Many of you may meet him in the coming years.

The statistical program of the U.S. Department of Agriculture dates to Civil War days with the founding of a Department of Agriculture. It has progressed over the years from very simple estimating procedures based largely upon observation to quite sophisticated sampling procedures, and, recently, research into use of satellite imagery to estimate crops.

Statistics are a fact of life, both the USDA program statistics and those generated by the various trade groups. The important thing about the USDA statistics is that they are collected using appropriate statistical techniques, are unbiased and furnished back to the producer.

Daniel L. Herbert,
State Statistician

EGG PRODUCTION UP SLIGHTLY

Montana's laying flocks produced 42 million eggs during the March through May 1981 quarter--up 2 percent from the same period a year ago. The average number of layers on hand during the quarter at 778,000 was up 7 percent.

The Nation's laying flock produced 17,527 million eggs during the March - May quarter--up slightly from last year. The number of layers averaged 28.3 million, slightly more than last year.

Farm Prices Up Slightly
Manufactured Dairy Production
Tractor Shipments Low
Cattle On Feed Up

PASTURE AND RANGE CONDITIONS IMPROVE

Rains over most of the State during May improved pasture and range prospects considerably. The much needed moisture greened up the State and conditions are approaching normal for this time of year. Shortage of stockwater is still a problem for ranchers in some eastern areas of the State.

The State's average condition of 82 improved 19 points from May 1 and is 25 points above June 1, 1980.

NOTABLE NUMBERS

During the 1979-80 marketing year 41 percent of the Nation's barley exports went to Asia, followed by 18 percent to the U.S.S.R. and 16 percent to Western Europe.

STATE	83	57	82

MONTANA CHERRY PRODUCTION UP

Montana's 1981 cherry crop is forecast at 1,800 tons--up 2½ times from last year's small crop. A couple of nights of freezing temperatures during blooming had an adverse affect. Precipitation during most of the blossom period resulted in poor pollination which also reduced the crop prospects.

Production in the six western states is forecast at 113,300 tons--down 17 percent from last year and 24 percent smaller than the 1979 production. Montana and Oregon are the only states showing increases from the previous year.

NEG. ESS 325-81 (6)

MANUFACTURED DAIRY PRODUCTION

Montana dairy plants made 179,000 gallons of ice cream during April--13 percent more than April 1980. Production of creamed cottage cheese at 517,000 pounds was up 18 percent from last year and 6 percent above March. Butter production at 167,000 pounds was down 3 percent from last year and 10 percent from March 1981.

JUNE 1 CROP PRODUCTION

Prospects for the 1981 Montana winter wheat crop continue to improve. Production is now forecast at 77.6 million bushels based upon conditions June 1--41 percent above last year and up 14 percent from last month's forecast. Acreage for harvest is forecast at 2,350,000 acres--9 percent above last year. The main producing areas received ample amounts of moisture during May, which enhanced yield prospects. Yield per acre in Montana is expected to be 33 bushels--7.5 bushels above last year and 4 bushels above last month's estimate.

Nationally, winter wheat production is forecast at a record high 2.01 billion bushels, 6 percent above last year, but 3 percent below the forecast a month ago. Freeze damage during May reduced prospects in several Plains States, particularly Kansas. The aggregate of the seven Plains Hard Red Winter States was down 9 percent from May 1--Montana showed the only increase for the group. These decreases were partially offset by improved 1981 prospects in the Corn Belt, Southern and Pacific Northwest States.

PRICES INCREASE SLIGHTLY

The May 1981 Index of Prices Received by Montana farmers and ranchers for all farm products at 282 (1967=100) was up slightly from the revised April index. The all crops index at 329 was 1 percent above April, but 24 percent above a year ago. The livestock and products index at 250 was the same as March, but 7 percent above May 1980.

In comparing May prices with April prices, increases were noted for durum wheat, spring wheat, lambs and hogs. Prices were down or remained the same for other commodities.

The May Index of Prices Received Nationally decreased 1 point (.4 percent) from April to 260 percent of its January-December 1967 average. Contributing most to the decrease since April were lower prices for eggs, soybeans, cattle, wheat, tomatoes, potatoes and corn. Higher prices for oranges, hogs, lettuce, broilers and hay were partially offsetting. The index was 32 points (14 percent) above a year ago.

The Index of Prices Paid by farmers for Commodities and Services, Interest, Taxes and Farm Wage Rates for mid-May was 304, unchanged from April. Price increases for feed, fertilizer, agricultural chemicals and family living items were offset by lower replacement livestock and gasoline prices. The May index was 28 points (10 percent) above a year earlier.

TRACTOR SHIPMENTS CONTINUE LOW

Wheel type tractor shipments in the U.S. for January - March 1981 totaled only 36,638 units--down 25 percent from this same 3 month period in 1980, and 35 percent lower than shipments during January - March 1979 according to "Current Industrial Reports" published by the Department of Commerce, Bureau of Census.

CATTLE ON FEED IN 7 STATES

Cattle and calves on feed June 1 for slaughter market in the 7 states preparing monthly estimates totaled 7.05 million head, a 3 percent increase from a year ago but down 8 percent from June 1, 1979. Marketings of fed cattle during May totaled 1.40 million, up 1 percent from last year but 13 percent less than May 1979. Placements of cattle and calves on feed in the 7 states during May were 1.62 million, virtually the same as last year but off 13 percent from 2 years ago. Net placements of 1.42 million were up 1 percent from last year but down 13 percent from May 1979. Other disappearance totaled 195 thousand head compared with 208 thousand in May 1980 and 218 thousand 2 years ago.

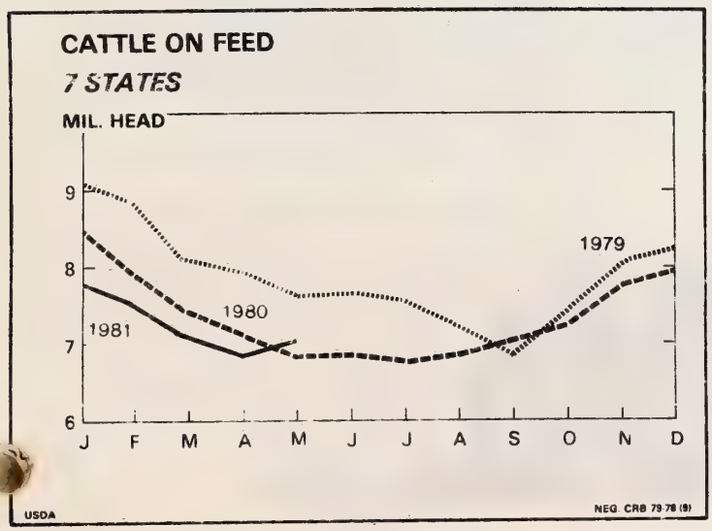
Winter Grain Condition--Northern Hemisphere
Exports for 1981 Expected to be higher

CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed May 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.03 million head, a 3 percent increase from a year ago but down 8 percent from May 1, 1979. This is the first year-to-year increase in the monthly number on feed since Spetember 1, 1980. Marketings of fed cattle during April totaled 1.39 million, off 3 percent from last year and 10 percent less than April 1979. Placements of cattle and calves on feed in the 7 States during April were 1.72 million, the highest for April since records began in 1972. April placements were 39 percent more than the low level of last year and 17 percent above 2 years ago. The strong increase in placements on feed was influenced by a shortage of forage from grazing in several of the major feeding States. Net placements of 1.58 million were up 43 percent from last year and 26 percent greater than April 1979. Other disappearance totaled 142 thousand compared with 130 thousand in April 1980 and 220 thousand 2 years ago.



NOTABLE NUMBERS

Over three-fourths of the increase in the 1981 U. S. winter wheat crop is in the Corn Belt and Southern states--soft red wheat.

1981 WINTER GRAIN CONDITION IN THE NORTHERN HEMISPHERE OUTSIDE THE UNITED STATES

The seeding of winter grains and generally favorable weather through March suggest that 1981 winter grain production in the Northern Hemisphere could be above that of 1980. Winter grain sowings were above the 1980 level in most of Western Europe, while reduced winterkill and adequate soil moisture portend improved winter grain harvests in the Soviet Union and Asia. Weather to date has only harmed production in northwest Africa and the Iberian Peninsula where drought has reduced prospects significantly. Delayed fall harvests in Eastern Europe reduced winter seedings to below plan, but since that time weather has been generally favorable. Weather during the next two to three months, however, will be very important in determining the final level of winter grain production.

Winter grain production, in the Northern Hemisphere excluding the United States, accounts for approximately one-half of all the foreign wheat and coarse grain produced each year. Regarding world grain production, winter grains accounted for about 30 percent of annual wheat and coarse grain production, nearly two-thirds of the world wheat crop, and 50 percent of the grain, excluding rice, for human consumption.

The role of spring grains cannot be overlooked, however, accounting for two-thirds of all grain production in the Soviet Union, nearly all grain output in Canada, and 50 percent of production in the People's Republic of China. In Europe and the Soviet Union, producers are opting for winter grains over lower-yielding spring grains. Where weather impeded winter plantings, larger plantings of spring grain are anticipated.

FARM REAL ESTATE TAXES

State legislation limiting the growth of property taxes and increasing the use of differential assessment laws have had at least a short-term impact on farm real estate taxes. Farm real estate taxes in 1977 totaled an estimated $3,038.7 million, a 6.4 percent increase from 1976. In 1978, farm real estate taxes declined by less than 1 percent from the 1977 estimated value to $3,021.6 million. However, in 1979 farm real estate taxes again began to rise, increasing by approximately 7 percent to an estimated value of $3,232.5 million. The United States average tax per acre increased from $3.14 in 1976 to $3.34 in 1977, decreased slightly in 1978 to $3.33, and again increased in 1979 to $3.57.

NUMBER OF FARM WORKERS STEADY

The total number of workers on Montana farms and ranches during the week of April 12-18, 1981 was estimated at 35,000--the same as the comparable week in April 1980. The number of farm operators plus unpaid family members working 15 hours or more per week was the same as last year. Hired workers at 10,000 was also the same as April 1980.

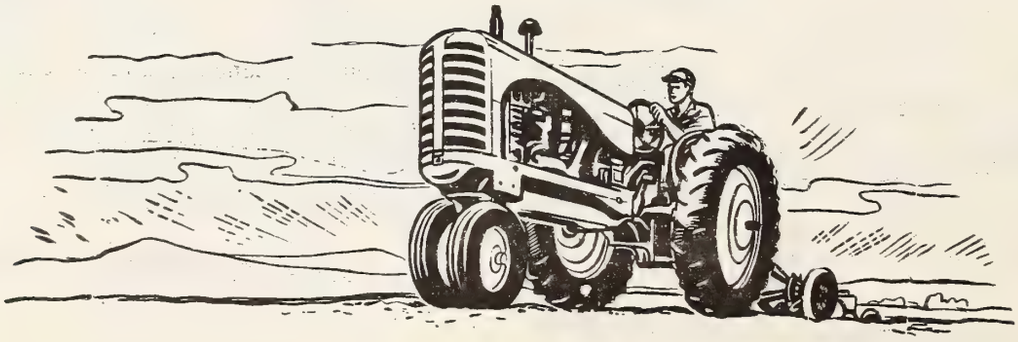
Discontinuance of Farm Labor Release

The April 24, 1981 Federal Register contains notification of intent to discontinue the Farm Labor Report with this release. This action is being taken as a cost cutting measure expected to save over $1,000,000 annually.



FISCAL 1981 U.S. AGRICULTURAL EXPORTS EXPECTED TO REACH $46 BILLION

U. S. agricultural exports in fiscal 1981 are now projected at $46 billion, $5.5 billion, or 14 percent, above last year's record. This is $1 billion below the February 1981 estimate because of reduced volume and prices for feed grains and oilseeds. Export volume is forecast at 167 million tons, 3 million above the year-earlier record. Increased grain exports will likely more than offset a projected decrease in exports of soybeans and soy products.

Some factors that may affect U.S. exports for the remainder of fiscal 1981 include:

* changes in general economic activity abroad and consumer demand for food,
* developments in livestock and poultry output and feed requirements,
* potential developments following the lifting of the USSR sales suspension,
* increased grain and oilseed supplies available from the Southern Hemisphere and favorable crop prospects in the Northern Hemisphere,
* the sensitivity of many U.S. export markets to the exchange rate,
* foreign exchange constraints in many less developed countries.

U.S. farm exports in the first 6 months of fiscal 1981 amounted to $24.3 billion, compared with $21.3 billion a year ago. Grain exports are running 10 percent above a year earlier, offsetting a 14-percent decline in the export volume of soybeans and soy products. Imports in the first half of the fiscal 1981 were $9.2 billion, 3 percent above last year.

MAY 1 POTATO STOCKS LOWER

Montana producers had 50,000 cwt in storage on May 1, 1981--down considerably from the 450,000 cwt on hand May 1, 1980.

Nationally, there were 40.2 million cwt in storage May 1, 1981. This is down 33 percent from a year earlier and 38 percent less than on May 1, 1979.

LIVESTOCK SLAUGHTER DOWN

Montana slaughter plants produced 10 percent less red meat during April than the same month one year ago. Total production at 13.9 million pounds compares with 15.4 million pounds in April 1980 and 13.7 million pounds in March 1981. The January - April red meat production is 6 percent below the same period last year.

Commercial red meat production for the United States in April 1981 totaled 3.30 billion pounds, down 1 percent from April 1980. January - April red meat production at 13.1 billion pounds was 2 percent more than last year. The 1981 accumulated production changes by individual components: Beef, up 5 percent; Veal, up 9 percent; Pork, down 3 percent; Lamb and Mutton, up 6 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for April included 22 weekdays and 4 Saturdays, the same as April 1980.

WHEAT OBJECTIVE YIELD SURVEY TO START

Montana's first forecast of winter production May 1 was 68.2 million bushels. With the recent rains everyone will be watching to see how the crop is developing. One of the best ways to see how the crop is shaping up is to go out to some fields and check it periodically.

That's just what enumerators from the Montana Crop and Livestock Reporting Service will be doing. Each month from late May until harvest they will be checking wheat fields to determine crop progress and yield potential. Two hundred and twenty sample fields of both winter and spring wheat throughout the State will be involved in the survey. With approval from the farmers, 2 plots will be placed in each field. Each month the enumerator will make various measurements, count wheat stocks, determine maturity and harvest a portion of the heads for weighing. The information from these objective yield counts and measurements help furnish reliable and timely production estimates.

NOTABLE NUMBERS

In the 1979-80 marketing year 36 percent of the U. S. Wheat Exports went to Asia, followed by 16 percent to South America and 13 percent to Africa.

U.S. EXPORTS OF PREPARED AND OTHER FEEDS APPROACHED $1 BILLION IN 1979/80

The United States exported 6.15 million tons of prepared, byproduct, alfalfa, and other feeds in 1979/80 (October-September). That was a 1.4 million ton (nearly 30 percent) increase over 1978/79. The export value of these feeds was just under a billion dollars, up 40 percent from the year before. Feeds derived from various grain-processing industries made up just over half the total on both a volume and a value basis.

Exports of prepared feeds in 1979/80 at 361,000 tons were over 50 percent above the reduced level of 1978/79. Increased exports to the Netherlands and Mexico accounted for much of the overall increase. Among prepared feeds, the "other feeds" category accounted for most of the increase. The value of all prepared feeds increased nearly a fourth to $99 million.

WINTER WHEAT FORECAST UP

The 1981 winter wheat crop for Montana is forecast at 68.2 million bushels as of May 1--24 percent above last year's crop. If realized it would be the largest crop since 1978. Montana farmers are planning to harvest 9 percent more winter wheat acreage than last year. Moisture received last fall resulted in good germination, and fair to good subsoil moisture supplies maintained the condition of the winter wheat despite the dry winter and spring.

Yield per acre is expected to be 29 bushels based upon producer reports of condition May 1, 4.5 bushels above last year. Rain since May 1 should reinforce production prospects. Even the eastern third of the State with increased acreage and a surprisingly good May 1 condition point toward a larger crop than in 1980.

Nationally, winter wheat production is forecast at a record high 2.08 billion bushels as of May 1--10 percent more than last year's production of 1.89 billion bushels and slightly above the December forecast. Three-fourths of the 187 million bushel larger winter wheat crop this year is in the five eastern Corn Belt and nine southern states.

FARMLAND LOSES GROUND TO 1980 INFLATION

U.S. farm real estate values normally outpace inflation, but not last year.

Farmland prices rose an average of 9.3 percent in the 12 months ending February 1, 1981, while general inflation, as measured by the Consumer Price Index (CPI), increased about 11 percent. Thus, on a "constant-dollar" basis, the value of U.S. farm real estate declined in 1980--the first such drop in a decade.

Even before adjustment for inflation, the 1980 performance wasn't up to par. The 9.3 percent rise was the smallest in 3 years. Farmland values increased 14 percent in 1978 and 15 percent in 1979. USDA analysts attribute the slowdown to several factors which discouraged buyers from bidding up the price of farmland:

--Net farm income fell from $31 billion in 1979 to $22 billion in 1980.

--Interest rates hit record highs in 1980, with the prime rate climbing to 20 percent in April, then dropping to 11 percent in July, and then shooting to 21.5 percent in December.

--Credit was tight during much of the year, making it difficult for many borrowers to secure loans.

Although the inflation-adjusted value of farmland dropped nationally, 11 states showed value increases that matched or outstripped the CPI. Mississippi topped the list. During the year ending February 1, 1981, prices there rose 27 percent (more than double the CPI rise). California prices increased by 22 percent (about double the CPI). Prices in Alabama, Louisiana, and Washington grew by 18 percent (about two-thirds more than the CPI).

The average acre of U.S. farm real estate (defined as land owned by farmers) was valued at $790 when farmers were surveyed early last February. State averages per acre ran from a high of $2,977 in New Jersey to a low of $160 in Wyoming (Alaska and Hawaii were not included in the survey).

Value averages for each state are shown on the accompanying map. Because real estate owned by farmers may include forest, grazing land, bogs or other land not under cultivation, the dollar averages for some states may not represent typical cropland values.

Fewer farm parcels changed hands in the 12 months ending last February 1 than in the preceding year.

APRIL FARM PRICES HIGHER

The April 1981 index of prices received by Montana farmers and ranchers for all farm products at 279 (1967=100) was up 3 percent from the revised March index. The all crops index at 314 was 1 percent above March and 21 percent above a year ago. The livestock and products index at 256 was 4 percent above March and 5 percent above April 1980.

In comparing April prices with March prices, increases were noted for spring wheat, oats, steers & heifers, calves and lambs. Prices were down for winter wheat, durum wheat, barley, hay, cows, sheep, milk & wool.

The April index of prices received by U.S. farmers decreased 1 point (.4 percent) from March to 261 percent of its January-December 1967 average. Contributing most to the decrease since March were lower prices for tomatoes, broilers, soybeans, wheat peppers, corn, lettuce and oranges. Higher prices for cattle, eggs and cotton were partially offsetting. The index was 36 points (16 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for mid-April was 305, up 3 points (1.0 percent) from March. The annual updating of the spring retail seed prices along with modest price increases for replacement livestock and family living items were the major contributors to the increase. The April index was 29 points (11 percent) above a year earlier.

HAY STOCKS

Hay stocks on Montana farms and ranches May 1 at 917,000 tons are 9 percent above last year. Hay supplies generally held up well because the winter was mild and livestock feeding requirements were light. However, many shortages were reported in the eastern third of the State which was affected by the drought last summer.

MANUFACTURED DAIRY PRODUCTION UP

Montana dairy plants made 180,000 gallons of ice cream during March--3 percent more than March 1980. Production of creamed cottage cheese at 490,000 pounds was up 20 percent from last year and 23 above February. Butter production at 186,000 pounds was up 18 percent from last year, but down 7 percent from February 1981.

PASTURE AND RANGE CONDITION VARIES

Topsoil moisture supplies across the State were generally short as of May 1 and supplies in the eastern half of the State were reported very short. The light snowpack the past winter and lack of any heavy rains this spring has resulted in very little runoff. As a result, stockwater dams in the eastern part of the State are low or dry.

The lack of moisture in the eastern half of the State has resulted in slow or very little new grass growth. Ranchers are still feeding hay to livestock in these areas. Pastures and ranges in the western half of the State are in much better condition.

JUMBO HOPPERS TAKE OVER RAILS

Forty-foot boxcars--once the prime movers of American grain--are fast fading into the past. Most railroads have switched to jumbo covered hopper cars.

Jumbo hoppers are loaded from the top and can carry 100 tons of grain. Boxcars carry a maximum of 60 tons and have higher per-car maintenance costs to prepare them for grain handling (installing special grain doors and patching holes to prevent leakage).

The number of 40-foot boxcars dropped from 107,300 in January 1977 to 47,000 last January, while railroads added an average of 17,000 new hoppers each year. Last year, more than 80 percent of all U.S. grain moved in hoppers.

Continuing additions of jumbo covered hopper cars to fleets have taken some of the heat off the rail transportation system. The larger loads carried by hopper cars more than offset the declines in the number of small, narrow-door boxcars, increasing railroads' overall grain-hauling capacity.

NOTABLE NUMBERS

Corn for grain in Montana reached a record high of 2 million bushels in 1918, and again in 1923. Recent years show less than a million bushels of corn for grain.

MILK PRODUCTION UP

Montana dairymen produced 78 million pounds of milk during the January - March 1981 quarter--10 percent more than the same period a year ago. Cows milked during the quarter averaged 29,000--up 1,000 from last year. The production per cow for the quarter increased nearly 6 percent from the same period last year--probably the result of the mild winter.

Compared with the previous quarter (October through December 1980) milk production in the State fell 1 percent or 1 million pounds. Cow numbers were the same for the two periods.

MONTANA RED MEAT PRODUCTION UP

Montana slaughter plants produced 3 percent more red meat during March than the same month one year ago. Total production at 13.7 million pounds compares with 13.2 million pounds in March 1980 and 13.1 million pounds in February 1981. The January - March red meat production is 5 percent below the same period last year.

Commercial red meat production for the United States in March 1981 totaled 3.38 billion pounds--up 9 percent from March 1980. January - March red meat production, at 9.81 billion pounds was up 3 percent from last year. The 1981 accumulated production changes by individual components were: Beef, up 6 percent; veal, up 10 percent; pork, down 1 percent; lamb and mutton, up 5 percent. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for March included 22 weekdays and 4 Saturdays, compared with 21 weekdays and 5 Saturdays for March 1980.

GRAIN STOCKS

Gail L. Cramer, Professer of
Agricultural Economics
Montana State University
Bozeman, Montana 59715

World grain stocks are estimated as of April 13 for the end of the 1980-81 marketing season (June 30) at 158 million tons which is about 3 percent above March estimates. Projected world wheat carryover for this crop year is 69.3 million tons, coarse grains 62.3 million tons, rice 26.1 million tons. These stocks were 32 million tons less than last year and represent only 11 percent of total utilization. Grain prices, however, in recent months have softened because of generally favorable growing conditions for winter grains, reasonable planting conditions for spring grains, and larger corn crops than expected in Argentina and South Africa. In addition, a record 1981 world grain crop is being projected. As a consequence, some stock recovery is projected.

As known, poor growing conditions higher import requirements or the building up of reserves by a country could influence the price outlook in 1981-82. Also, some price protection is afforded by U. S. farmer-owned grain reserve. Total quantity of wheat in the farmer-owned reserve and C.C.C. inventory are projected to be 65 percent of the total U. S. carryover stocks of 24.7 million tons on June 1.

WORLD GRAIN SITUATION AND OUTLOOK

Early season indications continue to suggest that grain production is likely to exceed world utilization in 1981/82 and that a further global stock drawdown next season is unlikely, unless weather is unusually poor in major grain producing countries. These indications, coupled with weak economic conditions in a number of countries and political tensions in Eastern Europe, have been key factors in the recent market weakness. The overall volume of world grain trade should continue to expand due to a strong underlying demand from developing countries and moderate growth in the industrialized countries. The uncertain status of the partial grain sales suspension to the USSR and of the US-USSR 5-year Grains Agreement continues to be a major variable in the 1981/82 outlook.

Although world grain trade is now expected to increase again in 1981/82, market conditions worldwide will depend heavily on what happens to crop production, general economic conditions, and government policies in the next few months. As farmers gear up for a major production boost in 1981/82 in response to relatively strong current prices, tight world grain supplies, and forecasts of firm demand, factors are at work which could lead to a possible reversal of the 1980/81 world stock drawdown. However, global stocks, especially coarse grain stocks, are likely to continue to be tight, particularly in the event of major crop shortfalls in several key countries.

MONTANA GRAIN STOCKS DOWN

Wheat stored on Montana farms and in mills and elevators April 1, 1981 totaled 94.0 million bushels--down 2 percent from a year ago. Winter wheat at 39.6 million bushels was down 23 percent from last year, but all spring wheat at 54.4 million was up 22 percent. The durum portion at 7.4 million bushels was up 13 percent from April 1980. About 82 percent of all wheat was stored on farms with the remainder in mills and elevators. Disappearance of wheat from storage during the January - April quarter at 40.2 million bushels was up 18 percent from a year ago.

Barley stocks in all positions at 12.7 million bushels were down 29 percent and oats at 2.8 million were off 30 percent.

Nationally, all wheat stored in all positions April 1, 1981 amounted to 1.33 billion bushels--up 9 percent from stocks on hand a year earlier, and 8 percent more than two years ago. Farm stocks of 543 million bushels are 5 percent less than last year's 570 million bushels. On farm storage this April 1 accounted for 41 percent of the total wheat stocks compared with 46 percent a year earlier. Off farm wheat stocks at the beginning of April totaled 791 million bushels. Indicated disappearance during the January - March quarter is 571 million bushels, compared with 491 million bushels for the comparable period a year ago. Of the April 1, 1981 all wheat stocks, 523 million bushels were under government control. This total includes 192 million bushels owned by the commodity credit corporation and 331 million bushels held in the farmer-owned reserve.

POTATO STOCKS DOWN

Montana producers had 720,000 cwt of potatoes in storage April 1, 1981--48 percent below last year. Disappearance since harvest amounted to 1,005,000 cwt.

Nationally potato stocks as of April 1, 1981 are estimated at 68.3 million cwt in the 15 major fall producing states. This is down 26 percent from April 1, 1980, and 31 percent less than on April 1, 1979.

FEWER CATTLE ON FEED

On April 1 cattle and calves on feed in Montana feedlots totaled 39,000 head--3 percent less than last April and 39 percent less than January 1, 1981. Steers on feed at 22,000 head were down 1,000 head from last April and heifers at 17,000 head were down 8,000 head from a year ago. Approximately 77 percent of all steers and heifers on feed weighed 700 pounds or more, and 18 percent weighed 900 pounds or more.

Marketings and other disappearance were responsible for the decrease in the number of cattle on feed. Marketings at 25,000 head were up 39 percent from last April and other disappearance (mainly movement to other feedlots and returning cattle to pasture) at 18,000 head was over double a year ago. Placements in lots during the January - March period totaled 18,000 head--up 6 percent from the same period a year ago.

Montana feeders expect to market 14,000 head of fat cattle during the April - June period, 26 percent less than the same period in 1980.

Cattle and calves on feed April 1 for slaughter market in 23 states totaled 9.76 million head, down 4 percent from a year ago, and 12 percent less than 2 years ago. This is the lowest April 1 number on feed since 1975.

Placements of cattle and calves on feed during the January - March quarter were 5.15 million, 1 percent fewer than in the corresponding quarter in 1980 and 12 percent less than the first quarter of 1979. Marketings of fed cattle for slaughter during January - March totaled 6.00 million, down 2 percent from the same period in 1980, and down 11 percent from January - March 1979. Both marketings and placements for the 23 states during the January - March quarter were the smallest since 1975.

Cattle feeders expect to market 5.54 million head during the April - June quarter of 1981. This would be 2 percent less than second quarter marketings in 1980 and 10 percent below the same period in 1979.

Land Values Increase

PASTURE AND RANGE CONDITION VARIES

As of April 1 both topsoil and subsoil moisture supplies were short in the eastern part of the State. Although pastures and ranges were open they were providing very little feed and most cattle and sheep were still on supplemental feed. Grass in the eastern part of the State is short or non-existant while grass in western Montana is coming along very well. Stockwater dams in eastern Montana that depend on runoff are very low or dry, as the moisture received has not been sufficient to replenish them.

NOTABLE NUMBERS

Montana hard spring wheat production was at record high of 60 million bushels in 1976.

WOOL PRODUCTION AND VALUE INCREASES

Shorn wool production in Montana during 1980 totaled 5.2 million pounds--4 percent above the previous year. Average weight per fleece was slightly above 1979. The average price rose 5 cents in 1980 to 99 cents per pound. As a result, the total value of the State's wool production rose 9 percent to 5.1 million dollars.

Montana ranked 7th in 1980 wool production for the Nation. Texas was number 1, followed by California which was number 2.

The U. S. shorn wool production during 1980 totaled 105 million pounds--up 1 percent from 1979. Total value of the shorn wool was 92.9 million dollars, up 3 percent from 1979. The average price per pound Nationwide was 88.1 cents for 1980 compared with 86.3 cents in 1979.

MEAT ANIMAL RECEIPTS DOWN

Total marketings of meat animals in Montana increased during 1980, but were offset by lower prices received which resulted in cash receipts of 679.7 million dollars--down 8 percent from the record high of 741.8 million set in 1979. Cattle and calves contributed 94.2 percent of the total cash receipts during 1980, while hogs represented 4.0 percent and sheep and lambs 1.8 percent of the total.

GRAIN PRICES LOWER

The March 1981 index of prices received by Montana farmers and ranchers for all farm products at 274 (1967=100) was down 2 percent from the revised February index. The all crops index at 300 was 6 percent below February, but 17 percent above a year ago. The livestock and products index at 258 was 1 percent above February, but 8 percent below March 1980.

In comparing March prices with February prices, increases were noted for cows, sheep, wool and milk. Prices were down for all wheat, barley, oats, calves, steers and heifers, lambs, hogs and eggs.

The March index of prices received by U.S. farmers decreased 5 points from February (1.9 percent) to 258 percent of the January - December 1967 average. Contributing most to the decrease were lower prices for hogs, cattle, soybeans, wheat, cotton and corn. Higher prices for oranges, onions, potatoes, tomatoes, lettuce and snap beans were partially offsetting. The index was 24 points (10 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for March 15 was 302, up 2 points (.7 percent) from mid-February. Price increases for family living items, fuels, fertilizers, agricultural chemicals and farm equipment were partially offset by lower prices for feed and feeder livestock. The index was 26 points (9.4 percent) above a year earlier.

MONTANA LAND VALUE INCREASE SLOWED

Montana agricultural land values increased an average of only 3 percent during the period February 1, 1980 to February 1, 1981. This compares to 17 percent a year ago, and is the smallest year to year increase since 1969.

Irrigated farmland with improvements was valued at $1,155 per acre this February compared with $1,035 a year earlier. Dry cropland with improvements was valued at $375--up 10 percent from $340 February 1, 1980. Non irrigated grazing land was reported at $175 per acre--down $5 from a year earlier.

Land value data are based upon reports from nearly 300 farmers and ranchers who reported value of agricultural land in their localities.

The values exclude land where value is affected by use or offer for non-agricultural purposes.

MANUFACTURED DAIRY PRODUCTION DOWN

Montana dairy plants made 105,000 gallons of ice cream during February--22 percent less than both February 1980 and January 1981. Production of creamed cottage cheese at 400,000 pounds was down 3 percent from last year and 7 percent less than January. Butter made at 201,000 pounds was up 11 percent from last year but down 10 percent from January 1981.

NOTABLE NUMBERS

Montana durum wheat production reached a record high of 18 million bushels in 1956.

MARCH INTENDED PLANTINGS UP

Montana farmers and ranchers plan to seed about 5 percent more acreage to spring crops in 1981 compared with last year. Although planting intentions for all spring wheat are up 1 percent, the durum wheat acreage portion is expected to be 6 percent above last year, and hard spring wheat acreage is unchanged. Last fall growers seeded 2.65 million acres to winter wheat. Combining this acreage with the March intentions for durum and hard spring wheat shows total 1981 wheat seedings may be slightly over 6 million acres--1 percent more than 1980. Oats and barley acreages are expected to be up 18 and 14 percent respectively from last year.

Intended corn acreage is up 6 percent, sugarbeet acreage up 2 percent, while dry bean intentions remain unchanged from a year ago. All hay acreage expected to be harvested depends mainly on future moisture supplies. Presently, farmers intend to harvest 7 percent more acreage than in 1980.

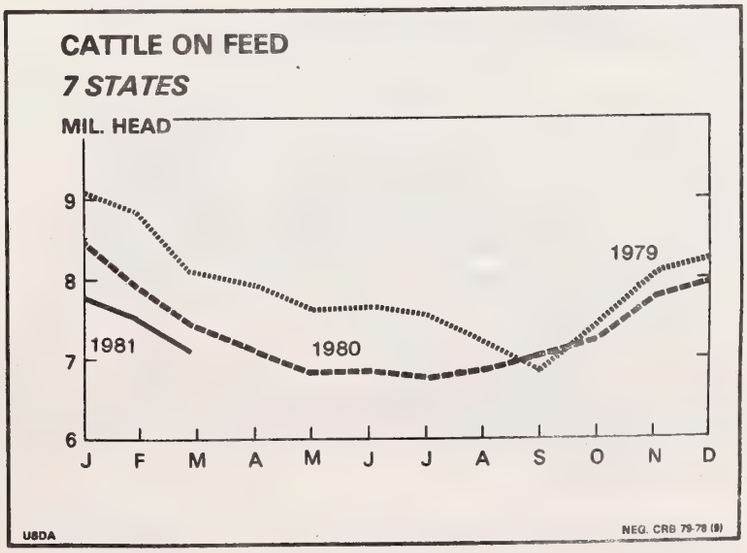
CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed March 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.13 million head, down 4 percent from a year ago and 13 percent less than March 1, 1979. This is the lowest March 1 number on feed since 1975. Marketings of fed cattle during February totaled 1.44 million, off 9 percent from last year and 13 percent less than February 1979. Both marketings and placements for February were the smallest since 1975.

Placements of cattle and calves on feed in the 7 States during February were 1.19 million, down 3 percent from last year and off 9 percent from 2 years ago. Net placements of 1.06 million were down slightly from last year and 7 percent from 1979. Other disappearance totaled 129 thousand compared with 155 thousand in February 1980 and 170 thousand in 1979.



CASH RECEIPTS
1980 PRELIMINARY

Marketings of crops and livestock in calendar year 1980 brought Montana farmers and ranchers 1377.4 million dollars--up slightly from 1979 according to preliminary USDA estimates. Livestock and livestock products receipts were down 9 percent but crop receipts were up 14 percent. The increase in government payments is largely the result of disaster payments to farmers caused by the drought during the summer of 1980.

TOTAL CASH RECEIPTS	1,405.4	1,431.4	132,834	139,301

1/ Revised. 2/ Preliminary.

MARCH 1 HOG INVENTORY DOWN

Inventory of hogs and pigs on March 1, 1981 in the 14 States conducting quarterly hog surveys is estimated at 50.1 million head, 9 percent below last year and 1 percent less than March 1, 1979.

The breeding inventory, at 7.22 million head, was 11 percent less than a year ago and down 13 percent from two years earlier. The market hog inventory, at 42.9 million head, was 8 percent less than last year but 1 percent greater than March 1, 1979.

The 14 Quarterly States account for about 85 percent of the U.S. hog and pig inventory.

The December 1980 - February 1981 pig crop in the 14 States totaled 17.6 million, 10 percent fewer than 1980 and 3 percent less than 1979. There were 2.43 million sows that farrowed. High temperatures last summer reduced conception rates and contributed to the reduction in number of sows farrowed during December - February to 89 percent of a year ago and 92 percent of same period two years ago.

Producers in the 14 States intend to farrow 3.02 million sows during the March - May 1981 period, 10 percent fewer than 1980 and 13 percent below two years ago.

Farrowing intentions reported for the June - August 1981 period are 2.60 million sows, 8 percent less than the same period a year ago and 17 percent below two years ago.

RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 9 percent less red meat during February than the same month one year ago. Total production at 13.1 million pounds compares with 14.4 million pounds in February 1980 and 14.5 million pounds in January 1981. The January - February red meat production is 9 percent below the same period last year.

Commercial red meat production for the United States in February 1981 totaled 3.01 billion pounds--down 1 percent from February 1980. January - February red meat production, at 6.43 billion pounds was down less than 1 percent from last year. The 1981 accumulated production changes by individual components were: Beef, up 2 percent; veal, up 7 percent; pork, down 3 percent; lamb and mutton, up 6 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for February included 20 weekdays (one a holiday) and 4 Saturdays, compared with 21 weekdays (one a holiday) and 4 Saturdays for February 1980.

WORLD OVERVIEW FOR WOOL

World wool production in the 1980/81 season is expected to total 3.5 billion pounds, clean, 0.5 percent above last season and 4 percent above the average of the past four seasons. An important factor limiting this increase from last year is the drought in Australia which has cut the current clip 4 percent. Several interrelated factors affecting clip size resulted from the prolonged drought, poor pasture growth, higher farm deaths, heavy marketings, etc. Australian sheep flocks are forecast to be 130 million head, down 4 percent from a year earlier. Severe drought conditions in South Africa have also kept production in that country at a low level. Poor weather and insufficient fodder in Russia last year caused sheep numbers to drop 1.5 percent below 1979. Argentina will have a 2 percent lower wool output because of flooding and a shift from sheep rearing to cattle grazing.

In contrast, several countries experienced favorable weather conditions which resulted in larger flock size and wool production. New Zealand is expected to have a wool clip 5 percent greater than last year because of abundant pasture growth. Uruguay has had good weather which indicates their wool production may increase 7 percent. Sheep numbers in China have been growing despite bad weather in some areas. Their current clip is expected to be 8 percent more than last year.

In summary, the current wool clip is expected to contain less of the finer wools because of the lower Australian clip and more of the coarser types from New Zealand and China. The merino share of the world clip is estimated to be 31.8 percent, compared to 32.6 percent last year. Crossbred and carpet wools should increase from 67.4 to 68.2 percent.

FOOD AND MARKETING

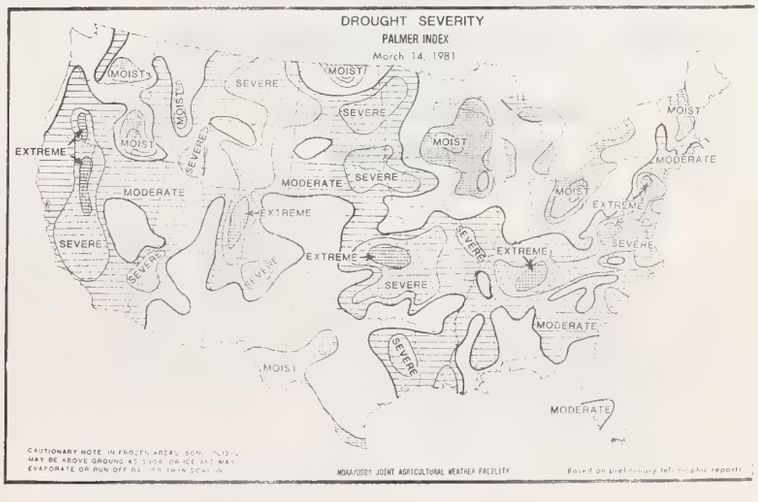
In 1981, the Consumer Price Index for food is expected to increase 10 to 15 percent from its 1980 average. The farm value of food is forecast to rise 12 to 20 percent, contributing significantly more to retail prices than last year, when it rose 6 percent. A 10 to 12 percent increase in marketing costs will also push up retail food prices.

Because of reduced supplies, retail prices of pork, sugar and peanut butter will increase sharply in 1981. Pork supplies will be lower as a result of planned production cutbacks, producer's response to the low hog prices of first-half 1980 and net operating losses through much of last year. Pork production this year is expected to fall 5 to 7 percent from 1980 levels. Coupled with only modest changes in beef and poultry production, this drop in pork output will cause total supplies of red meats and poultry to decline in 1981. As a result, retail prices of all meat items are expected to increase 13 to 15 percent, with pork prices up 18 to 20 percent.

World sugar production has fallen short of consumption for the last two growing seasons; consequently, global reserves have been pulled down sharply. This tight supply situation caused retail sugar prices to climb about 23 percent in 1980. Because of the high prices, some countries may resort to rationing this year, which would reduce consumption needs. Nevertheless, retail prices are still expected to average 15 to 20 percent higher than in 1980.

U. S. peanut production this past fall declined 42 percent from year-earlier levels, mainly because of the hot, dry summer in major producing States. Import quotas have been raised to supplement the shortage; even so, consumers will find fewer peanuts available in 1981 and prices tripled between August and December. Retail prices have begun to reflect these increases and are expected to remain high at least until next fall's harvest.

Source: Agricultural Outlook Jan.-Feb. 1981



EGG PRODUCTION INCREASES

Montana's laying flocks produced 43 million eggs during the December 1, 1980 through February 28, 1981 quarter--up 23 percent from the same period a year ago. The average number of layers on hand during the quarter at 770,000 was up 18 percent. Most of the increase is the result of bringing flocks to levels established before the PCB incident when many layers had to be destroyed.

The Nation's laying flocks produced 17,468 million eggs during the same quarter--down 1 percent from last year. The number of layers averaged 292 million, about the same as a year ago.

TRACTOR SHIPMENTS DOWN

The Bureau of the Census reports wheel-type tractor shipments from factories totaled 147,385 during calendar year 1980--down 27 percent from 1979 and 16 percent below 1979.

Tractor shipments have been down each month since February this year. Dealer inventories must be large and/or sales down.

POTATO STOCKS DOWN

Montana producers had 1.3 million cwt of potatoes in storage on March 1, 1981--20 percent below last year at this time.

Potato stocks in the 15 major fall potato producing states as of March 1, 1981 are estimated at 94.2 million cwt. This is down 23 percent from March 1, 1980 and 29 percent less than on March 1, 1979.

FISCAL 1981 FARM EXPORTS NOW EXPECTED TO REACH $47 BILLION

Exports of U. S. farm products in fiscal 1981 are expected to reach a record $47 billion, 16 percent above last year's $40.5 billion, but $1.5 billion below the previous estimate in November 1980. Export volume for the fiscal year is projected at 169 million tons, 3 percent above last year's record but 1.5 million tons below the November estimate. Agricultural imports are expected to hit $18 billion, 4 percent above fiscal 1980. This is $500 million below the November estimate, reflecting lower than anticipated quantity and price for the two major import commodities--coffee and sugar. As a result, the agricultural trade balance will approach a record $29 billion, compared with $23 billion in fiscal 1980.

Exports during the first quarter of fiscal 1981 (October-December) amounted to $11.7 billion, 7 percent above a year earlier. However, the increase was below expectations for the first quarter, mainly reflecting price weakness as a result of generally favorable crop developments in the Southern Hemisphere, high U. S. interest rates, and sluggish demand for soybeans and products in Western Europe. Export volume was down 2 percent with wheat, soybeans, cotton, sunflowerseed, and soybean meal showing significant decreases. Animal product exports also had a disappointing first quarter as exports were only 2 percent above year-ago levels.

NOTABLE NUMBERS

Montana had over 200,000 milk cows in the early 1930's, compared to 29,000 the first of this year.

POLAND A TOP CUSTOMER

Poland is expected to once again be the top East European customer for U. S. agricultural goods this fiscal year.

Last year, our farm sales to Poland reached a record $638 million, of which $563 million was in loans through the Commodity Credit Corporation (CCC). Exports of corn, the leading sales item, were valued at $316 million. Soybean meal sales totaled $91 million, soybean sales $84 million, and wheat sales $41 million.

The next largest East European importers of U. S. farm goods were East Germany, with purchases totaling $493 million, and Romania, with sales reaching $468 million.

For fiscal 1981, Poland has been granted the largest CCC credit line in history--$670 million--and the polish government is seeking an additional $200 million.

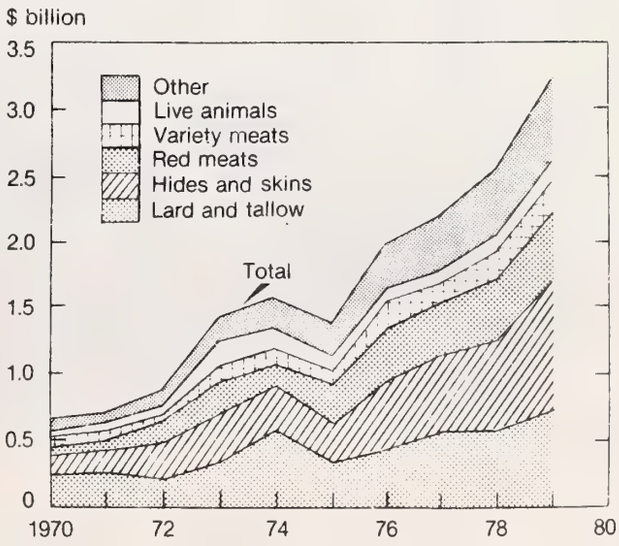
U.S. Exports of Livestock Products



FARM PRICES VARIED

The February 1981 index of prices received by Montana farmers and ranchers for all farm products at 276 (1967=100) was up 1 percent from the revised January index. The all crops index at 307 was 2 percent below January, but 18 percent above last year. The livestock and products index at 253 was 2 percent above January, but 12 percent below a year ago.

In comparing February prices with January prices, increases were noted for barley, cows, calves, sheep, lambs, hogs, eggs and wool. Prices were down for all wheat, oats, hay,steers and heifers, and milk.

The February index of prices received by U. S. farmers decreased 1 point (.4 percent) to 263 percent of its January - December 1967 average. Contributing most to the decrease were lower prices for soybeans, wheat, oranges, cotton and cattle. Higher prices for tomatoes, hogs and and potatoes were partially offsetting. The index was 28 points (10 percent) above a year ago.

MANUFACTURED DAIRY OUTPUT UP

Montana dairy plants made 134,000 gallons of ice cream during January--8 percent more than January 1980 and 16 percent more than December 1980. Creamed cottage cheese manufactured at 431,000 was up 3 percent from last year and 5 percent above December. Butter made at 223,000 pounds was up 4 percent from last year and 14 percent above last December.

NOTABLE NUMBERS

The Corn Belt and southern states accounted for nearly two-thirds of the National 6.5 million acre increase in winter wheat seeding for the 1981 crop.

SLAUGHTER OUTPUT DOWN

Montana slaughter plants produced 9 percent less red meat during January than the same month one year ago. Total production at 14.5 million pounds compares with 16.0 million pounds in January 1980 and 16.1 million pounds in December 1980.

Commercial red meat production for the United States during January 1981 totaled 3.42 billion pounds--up 1 percent from January 1980. The January cattlekill was up 3 percent while the hogkill fell 3 percent. Sheep and lambs slaughtered were up 9 percent.

Kill days for January included 22 weekdays (one a holiday) and 5 Saturdays, compared with 23 weekdays (one a holiday) and 4 Saturdays in January 1980.

FARM LABOR

The total number of workers on Montana farms and ranches during the week of January 11-17, 1981 was estimated at 33,600--34 percent more than January 1980. Farm operators plus unpaid family members working 15 hours or more per week were up 50 percent from last year, and hired workers were up 7 percent from January 1980.

COST OF PRODUCTION SURVEY

What does it cost to produce cattle, hogs, and sheep?

USDA interviewers will ask more than 6,500 livestock producers and feeders in 36 states for an hour of their time in March to answer questions about their cost of production and other characteristics of their operations.

Cost of production surveys for livestock are conducted by USDA every 5 years, with the data updated between survey years through a computer-based estimating procedure. The surveys provide cost of production budgets for different size operations in each region of the country.

The data are summarized each year in a special report to the Senate agriculture committee. The report provides lawmakers, farmers, and ranchers with information on annual costs and returns to different types of operations.

The information supplied by the farmers is also used to update the national inventory of equipment, facilities, tractors, and trucks, and to analyze the structure of the operations: livestock replacement rates, births and deaths, average sales rates and labor required.

The survey sample will include 3,700 beef cow operators in 36 states, 1,800 hog producers in 18 states, 700 sheep producers in 13 states, and 300 farmer-feeders in five states. Large commercial feedlots will be surveyed later.

POTATO STOCKS DOWN

On February 1, 1981 Montana producers had 1.58 million cwt of potatoes in storage--5 percent below one year ago.

There were 118 million cwt in storage on February 1, 1981 in the 15 major fall states. This is 20 percent below February 1, 1980 and 27 percent below February 1, 1979. Of the total stocks on hand in the 11 major states, 77 percent were Russetts, 20 percent Whites and 3 percent Reds.

WHEAT UTILIZATION

Montana wheat shipped to out-of-State destinations in the 1979 marketing year (June 1979 - May 1980) is estimated at 112.2 million bushels--including unaccounted disappearance. Wheat used in the State for feed, seed and flour amounted to 16 million bushels--12 percent of total disappearance.

Wheat shipped into the Pacific Northwest, including an allowance for unaccounted disappearance, was 92.7 million bushels. Pacific Northwest flour mills used 16.5 million bushels of Montana wheat to mill flour, and 76.2 million bushels were exported from Pacific Northwest ports. Compared with last year, flour use was down 23 percent and exports were down 10 percent.

Montana wheat accounted for 39 percent of the Pacific Northwest exports in crop year 1979.

Funds for wheat utilization and movement were furnished by the Montana Wheat Commission.

NOTABLE NUMBERS

National beef and veal imports including quota, non-quota and live animals, reached a record high of 3 billion pounds (carcass weight equivalent) in 1978. This was 11 percent of domestic consumption.

CATTLE NUMBERS UP

Montana's cattlemen held 2.7 million cattle and calves in their inventory on January 1, 1981--1 percent more than a year ago. The herd build-up which started during 1979 was slowed this year by drouth in the eastern third of Montana. The number of heifers kept for herd replacement in the inventory would indicate that herd expansion will likely be slow during 1981 also.

Class inventory and changes from a year ago are: beef cows 1.5 million head--up 1 percent; milk cows 29,000--up 1 percent; bulls 85,000--down 2 percent; heifers kept for beef replacement 276,000--unchanged; other heifers over 500 pounds 111,000--unchanged; steers over 500 pounds 146,000--up 15 percent; calves under 500 pounds 580,000--unchanged. The 1980 calf crop was estimated at 1.52 million head--2 percent more than the previous year's total.

All cattle and calves in the United States on January 1, 1981 total 115 million head--up 3 percent from the 111 million a year ago. This was the second year of the current cattle cycle's upward trend. All cows and heifers that have calved number 49.9 million--up 4 percent from the 47.9 million as of January 1, 1980.

Beef cows, at 39.0 million, are up 5 percent from the 37.1 million a year ago. Beef heifers are up 4 percent and calves are up 6 percent.

The 1980 calf crop is estimated at 45.4 million-up 6 percent from 1979.

(Page 4 shows inventory by state.)

PRODUCER CONTROLLED OFF-FARM WHEAT STOCKS

Montana wheat producers retained pricing control on 13.5 million bushels stored in off-farm facilities on January 1, 1981--65 percent of the total wheat stored off-farm. A year ago 16.2 million bushels were producer controlled--71 percent of the total off-farm stocks.

Producer owned grain stored in commercial off-farm storage facilities is defined as grain for which the producer has some marketing control.

SHEEP INVENTORY CLIMB CONTINUES

Montana's sheep and lamb numbers continued to climb last year. The January 1, 1981 inventory was 595,000 head, up 4 percent from the same date one year ago. This is the second year with increased numbers in Montana.

Ewes one year old and older were up 5 percent from last year. Ewe lambs were down 4 percent, but their number is still large enough to provide normal replacements and increase the size of next year's breeding flock.

Sheep and lambs on feed at 15,000 were up 1,000 from last year, probably as a result of lambs being kept on the farm or ranch on a fattening ration.

The 1980 lamb crop at 390,000 was up 8 percent. The value of all sheep and lambs on farms and ranches at the beginning of 1981 was $41.4 million, down 21 percent from last year. Lower market prices for all classes of sheep pulled the inventory value down.

Nationally the number of sheep and lambs is 2 percent above last year at 12.9 million head--the second year of increased numbers.

INDEX OF FARM PRICES UP

The January 1981 index of prices by Montana farmers and ranchers for all farm products was 271 (1967 = 100) compared with 267 a month earlier and 265 for January 1980. The All Crops Index at 320 was 1 percent above last month and 25 percent above last year. The livestock and products index at 238 was up 2 percent from last month, but 14 percent below a year ago.

Comparing January prices with December prices increases were noted for all wheat, barley, calves, sheep and milk. Prices went down for cows, steers and heifers, lambs, oats and eggs; but prices for hay and wool were unchanged.

The January index of prices received by United States farmers decreased 2 points (.8 percent) to 263 percent of its January - December 1967 average. Contributing most to the decrease since December were lower prices for hogs, eggs, soybeans and cattle. Higher prices for corn, potatoes, tomatoes and peanuts were partially offsetting. The index was 26 points (11 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for January 15 was 299, up 7 points (2.4 percent) from mid-December. The annual updating of the indexes for farm services and cash rent, interest and taxes along with higher prices for feed, fuel and family living items were the major contributors to the increase. The January index was 29 points (11 percent) above a year earlier.

CHICKEN NUMBERS INCREASE

The number of chickens on Montana farms December 1, 1980 totaled 965,000--8 percent more than a year earlier. The inventory included 760,000 hens and pullets of laying age and 199,000 pullets not of laying age. The inventory value of all Montana chickens December 1, 1980 increased 18 percent to $2,364,000. The average value per bird at $2.45 was 20 cents more than the previous year.

WINTER WHEAT SEEDINGS BY REGIONS

The following table showing winter wheat seedings by groups of states points out the disproportionate increase in seeded acreage in the Corn Belt and southern states this past fall.

The five Corn Belt states with only 12 percent of the winter wheat acreage in 1980 account for 25 percent of the National 1981 increase in acreage; and the nine southern states with only 7 percent of the acreage in 1980 account for a whopping 36 percent of the 1981 United States increase. Together these 2 regions contribute 61 percent of the winter wheat acreage increase from 1980.

Montana winter wheat seedings last fall were 2.65 million acres, up only 2 percent for 1980.

MANUFACTURED DAIRY OUTPUT UP

Montana dairy plants manufactured 116,000 gallons of ice cream during December--20 percent more than December 1979, but 9 percent less than November 1980. Creamed cottage cheese output at 411,000 pounds was up 16 percent from a year ago. Butter production at 195,000 pounds was up 27 percent from last year.

More Milk Produced

HONEY PRODUCTION SECOND LARGEST

Montana's 1980 honey production, estimated at 10.7 million pounds, is second only to the record crop in 1979. The 1980 production was 19 percent below the 1979 record, but 22 percent above the low 1978 production. The number of colonies in 1980 at 103,000 was unchanged from a year ago but drought in eastern Montana and volcanic ash fallout in western Montana combined to lower the yield per colony from 128 to 104 pounds per colony. In 1980, Montana ranked 5th in U.S. honey production.

The U.S. honey crop in 1980 totaled 200 million pounds, 16 percent less than the 1979 crop of 238 million pounds. The number of colonies was down slightly at 4.14 million and yield per colony declined to 48.2 pounds from 57.2 pounds in 1979. Honey stocks on hand totaled 40.3 million pounds-6 percent above last year.

HONEY & BEESWAX PRODUCTION, PRICE AND VALUE

POTATO STOCKS DOWN

On January 1, 1981 Montana producers had 1.61 million cwt in storage--7 percent below last year at this time.

There were 144 million cwt of potatoes in storage on January 1, 1981 in the 15 major states. This is 18 percent less than January 1, 1980 and 26 percent below January 1, 1979. Of the total stocks on hand, 74 percent were Russets, 23 percent Whites and 3 percent Reds.

NOTABLE NUMBERS

U. S. beef and veal production in 1980 at nearly 10 million metric tons ranks first in the world and compares to 6.8 million tons for each the European Community and the USSR.

RED MEAT PRODUCTION UP

Montana slaughter plants produced 19 percent more red meat during December than the same month one year ago. Total production at 16.1 million pounds compares with 13.6 million pounds in December 1979 and 14.6 million pounds in November 1980. Production for January-December 1980 at 183.0 million pounds is 13 percent more than the same period in 1979.

Commercial red meat production for the United States during December 1980 totaled 3.35 billion pounds, up 9 percent from December 1979. January-December red meat production at 38.6 billion pounds was 4 percent above last year. The 1980 accumulated production changes by individual components were; beef, up 1 percent; veal, down 8 percent; pork, up 8 percent; lamb and mutton, up 9 percent.

Kill days for December included 23 weekdays (1 a holiday) and 4 Saturdays compared with 21 weekdays (1 a holiday) and 5 Saturdays a year ago.

MORE CATTLE ON FEED

Cattle and calves on feed January 1 in Montana feedlots for the slaughter market totaled 64,000 head--12 percent more than last January and 64 percent more (up seasonally) than the number being fed on October 1. Steers on feed at 34,000 head were up 36 percent from last January and heifers at 27,000 head were unchanged from a year ago. About 48 percent of all steers and heifers on feed weighed 700 pounds or more, and 23 percent weighed 900 pounds or more.

Placements in lots during the October-December period totaled 55,000 head--up 6 percent from the same period a year ago. Montana feeders expect to market 28,000 head during the January-March period, 56 percent more than the same period in 1980.

USDA ALTERS PROSPECTIVE PLANTING REPORT SCHEDULE

The U.S. Department of Agriculture's Crop Reporting Board issued a modified Prospective Plantings Report on Jan. 21, covering planted acreages of cotton, rice, corn, oats, barley, sorghum, sweet potatoes, soybeans, and peanuts in 16 southern states of Alabama, Arizona, Arkansas, California, Florida, Georgia, Kentucky, Louisiana, Mississippi, New Mexico, North Carolina, Tennessee, Texas, Oklahoma, South Carolina and Virginia.

A second Prospective Plantings Report for major spring planted crops for 32 states including Montana, will be issued in late March.

The January report will be updated in selected areas if events suggest farmers are likely to change their earlier planting intentions.

The January and March reports will be combined to provide a national Prospective Plantings Report in lieu of the usual April report.

Montana Grain Stocks

Wheat stored on Montana farms and in mills and elevators January 1, 1981 totaled 130.9 million bushels--up less than 1 percent from a year ago.

Disappearance since October 1 was 44.8 million bushels, up 18 percent from a year ago. Farm storages held 110.2 million bushels--3 percent above a year ago and commercial storages held 20.7 million--down 10 percent.

Winter wheat at 62.0 million bushels was down 10 percent from last year. Spring wheat stocks excluding Durum were 59.8 million bushels--down 2 percent from a year ago. Durum in storage amounted to 9.1 million bushels--up 10 percent.

Barley stocks at 33.4 million bushels were down 5 percent and oats stocks at 4.3 million were down 41 percent.

Nationally, all wheat stocks in all storage positions totaled 1.90 billion bushels--11 percent more than last year. Farm storages contained 754 million bushels of wheat--40 percent of the total January 1, 1981 stocks.

Durum wheat stocks totaled 103 million bushels--3 percent below last year. U.S. Barley stocks were 303 million bushels--17 percent less than one year ago.

MILK PRODUCTION UP

Milk produced in Montana during the October-December 1980 quarter totaled 79 million pounds, 10 percent more than for the same quarter in 1979. The number of cows milked during this quarter averaged 29,000, up 1000 from the previous year. The amount of grain fed per milk cow in herds on January 1 was 12.5 pounds per day--unchanged from January 1 a year ago.

MORE MONTANA FARMS

Montana farm numbers in 1980 are estimated at 23,800--up 100 from last year. The preliminary estimate of farm numbers for 1981 is 23,900. The new estimate of farming units published by the U.S. Department of Agriculture is the result of a detailed review of 1974 and 1978 Census data and other statistical information from 1975 through 1980.

The latest farm number series is above the previous series and shows the farm number decline halted between 1975 and 1976--thus ending a 45-year trend. Since 1976, there has been a slow increase in units that meets the definition of a farm (the official definition, used since 1975, includes places from which $1,000 or more of agricultural products were sold or normally would be sold during the previous year). The census of agriculture shows that from 1974 to 1978 the largest increase took place in the smaller size groups, especially the 10-49 acre groups, as the larger size groups continued in a downward trend. The amount of land in Montana farms has been unchanged since 1977.

Montana joined 19 other states showing increased farm numbers from 1979 to 1980. However, the national total continued its downward trend--showing 2,000 fewer farms.

1/ Preliminary.

FARM PRICES LOWER

Montana farmers and ranchers received slightly lower prices for their crops and livestock on December 15 compared with a month earlier. The December 1980 index of prices received by the State's farmers for all farm products at 278 (1967=100) was down less than one percent from the revised November index, but 3 percent above December 1979. The all crops index at 317 was unchanged from last month but 20 percent above last year. The livestock and products index at 253 was also unchanged from last month but was down 8 percent from a year ago.

In comparing December prices with November prices, increases were noted for barley, oats, milk, and eggs. Prices went down for all other items except hay and wool which remained unchanged from the previous month.

The December index of prices received by U.S. farmers decreased 3 points (1.1 percent) to 261 percent of its January-December 1967 average. Contributing most to the decrease since November were lower prices for soybeans, oranges, wheat, hogs, cattle, and lettuce. Higher prices for eggs, corn, peanuts, tobacco, and rice were partially offsetting. The index was 22 points (9.2 percent) above a year ago.

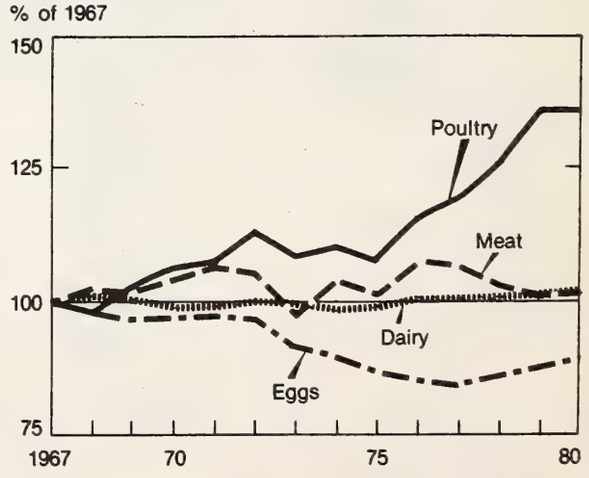
MONTANA HAY STOCKS UP

January 1 hay stocks on Montana farm and ranches totaled 4,045,000 tons---5 percent more than on the same date last year. Hay supplies are still tight and high priced in the Eastern third of the State, but feeding requirements have been eased considerably by the mild winter.

The United States hay stocks on farms January 1 totaled 92.0 million tons---15 percent below the record high a year earlier and the lowest January 1 stocks since 1977.

Per Capita Consumption of Selected Animal Products



Dairy includes butter. 1980 projected.

BUTTER AND ICE CREAM PRODUCTION UP

Montana dairy plants manufactured 127,000 gallons of ice cream during November - 17 percent more than November 1979 but 18 percent less than October 1980. Creamed cottage cheese output at 372,000 pounds was 3 percent less than last year. Butter production at 193,000 pounds was up 16 percent from a year ago but 3 percent less than last month.

Winter wheat seedings up
Small grain production increases
Fewer potatoes in storage
Red meat production drops
December 1 hog inventory up
Egg production higher

NOTABLE NUMBERS

In 1974, 25 percent of Montana's farm and ranch land was cropland, 70 percent was rangeland or pasture, and 5 percent woodland or wasteland.

1981 WHEAT OUTLOOK

The wheat market is international in scope. Worldwide crops and events influence the market. Currently, worldwide stocks of all grains are only 10.5 percent of total world use, the lowest in recent years--even lower as a percent of use than during the food crisis years of 1966-67 and 1972-75. The actual level of stocks is about 151 million tons compared to 132 million tons in 1974/75. Lower stocks are a result of increased human and livestock use. World trade in grains has increased from 110 million tons in 1970/71 to a projected 206 million tons in 1980/81. This general situation, however, primarily describes coarse grains. World stocks of wheat and rice are moderate. Montana and United States winter wheat producers are responding to the higher wheat prices in 1980. Montana farmers have increased winter wheat plantings 2 percent to 2.65 million acres and U.S. acreage to 63.9 million acres--up 11 percent over 1980. This winter wheat acreage is a new record acreage compared to 61.2 million acres planted in the fall of 1948.

The embargo on grain to the Soviet Union will probably end but it will have little impact on the total grain outlook. Russia can only import about 36 million tons because of capacity limitations and they are importing close to that capacity, 35 million tons of wheat and coarse grains. This amount of imports will necessitate a cutback in their livestock feeding. Factors which could still influence the 1980/81 outlook include grain production outturns in the Southern Hemisphere countries, any additional changes in global import requirements and the "bearish" nature of early 1981 U.S. planting intentions and crop outlook.

The outlook for 1981 wheat prices will depend primarily on the 1981 coarse grain crops, world weather, and on U.S. relations with the USSR and China. Given good weather and a trend increase in exports, ample supplies of wheat will be available and some stock buildup may occur.

Agricultural Economics
Montana State University
Bozeman, MT 59717

RED MEAT PRODUCTION DROPS

Montana slaughter plants produced 13 percent less red meat during November than the same month one year ago. Total production at 14.6 million pounds compares with 16.7 million pounds last November and 16.9 million pounds in October 1980. Production for January-November 1980 at 166.9 million pounds is 13 percent more than the same period in 1979.

Commercial red meat production for the United States during November 1980 totaled 3.10 billion pounds--down 6 percent from November 1979. January-November red meat production at 35.2 billion pounds was 3 percent more than last year. The 1980 accumulated production changes by individual components were: beef, up less than 1 percent; veal, down 9 percent; pork, up 8 percent; lamb and mutton, up 8 percent.

Kill days for November included 20 weekdays (2 were holidays) and 5 Saturdays compared with 22 weekdays (2 were holidays) and 4 Saturdays a year ago.

WINTER WHEAT SEEDINGS UP

Montana farmers planted 2.65 million acres of winter wheat this past fall for harvest in 1981, an increase of 2 percent from last year's seedings. Based upon farmer-reported conditions of the crop on December 1, the estimate for 1981 production is 68.9 million bushels--up 26 percent from 1980. The great increase is due to a larger acreage expected for harvest as poor germination due to the dry fall of 1979 and some winterkill sharply reduced the 1980 harvested acres. Winter wheat was seeded under generally dry conditions, but moisture received after mid-October improved condition of the crop before going into winter dormancy.

Nationally, growers seeded a record high 63.9 million acres in the fall of 1980 for the 1981 crop--11 percent more than last year. Production of the 1981 crop based on December 1 condition is forecast at 1.98 billion bushels--5 percent more than in 1980.

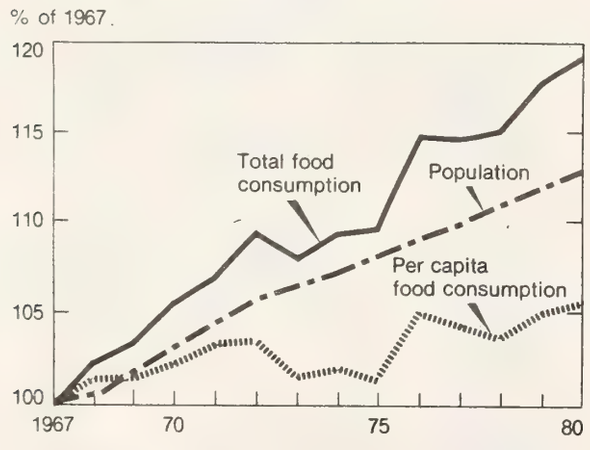
Population and Food Consumption



Total food consumption based on retail weight using constant retail prices as index weights. Civilian population on July 1, for 50 States. 1980 projected.

MONTANA HOG NUMBERS UP

Montana hog numbers were up 20 percent from last year. The December 1, 1980 inventory of 250,000 head included 11 percent more breeding hogs and 21 percent more market pigs. Lighweight pigs (under 60 pounds) showed the greatest increase over last year--45 percent more. The heavier weight groups showed smaller changes with those weighing 120-179 pounds down 7 percent and the 180 pounds and over weight group up 8 percent.

The State pig crop for 1980 was 370,000--up 20 percent from the previous year. The spring pig crop (December-May) at 185,000 was up 19 percent and the fall pig crop farrowed during June-November at 185,000 was up 21 percent.

Nationally, the inventory of all hogs and pigs is estimated at 64.5 million head on December 1, 1980. This is 4 percent below a year ago but 7 percent more than December 1, 1978. Breeding inventory at 9.16 million is 5 percent below both a year ago and December 1, 1978. Market hog inventory at 55.4 million is 4 percent fewer than a year earlier but 9 percent more than two years ago.

The U.S. pig crop for 1980 totaled 101.6 million head--1 percent below 1979 but 15 percent above the 1978 pig crop. The December 1979-May 1980 pig crop estimated at 52.3 million head is up 3 percent from a year earlier and 23 percent above two years ago.

The June-November 1980 pig crop estimated 49.3 million head is 5 percent fewer than a year ago but 7 percent above the June-November 1978 crop.

U. S. hog producers intend to have 6.78 million sows farrow during the December 1980-May 1981 period--6 percent below both a year ago and the same period two years ago. These intentions and projected litter size indicate a pig crop of 48.5 million--7 percent below 1980 and 4 percent below the December 1978-May 1979 crop.

1980 SMALL GRAIN PRODUCTION UP

Montana farmers produced 167.1 million bushels of wheat, barley and oats in 1980--3 percent more than a year earlier. The increase was achieved inspite of a severe drought in the eastern third of the State. Compared with 1978 however, this year's small grain production was down 21 percent.

Total wheat production at 119.8 million bushels was up 3 percent from 1979. Winter wheat was down 4 percent, durum was up 11 percent, and hard spring wheat was up 10 percent.

Barley production at 44.1 million bushels was up 9 percent. Oats production at 3.2 million bushels was down 34 percent.

All wheat production for the nation totaled 2.4 billion bushels--up 11 percent from 1979. Barley production at 359 million bushels was down 6 percent, and oats production at 458 million bushels was down 13 percent from last year.

End-of-season statistics for other crops will be released January 14, 1981.

MORE EGGS PRODUCED

Laying flocks in Montana produced 47 million eggs in the September 1 through November 30 quarter. This is 7 million more than the same period last year. The main reason for the large increase is that laying flocks have been restored to levels prior to the PCB incident during the same quarter last year when a large number of layers had to be destroyed.

Nationally, 17.4 billion eggs were produced in the September-November quarter--slightly more than the same period last year.

Building Bridges To China

BUILDING BRIDGES TO CHINA

Last year, USDA experts painted a rosy picture of U.S. trade prospects with China.

They predicted that China would enter the ranks of nations with billion-dollar purchases of U.S. farm products in Fiscal 1980. They also expected China to nudge its way into the top 10 U.S. markets for farm goods.

What happened exceeded even the most optimistic forecasts. When final figures are in, China's purchases are expected to reach around $2 billion in the year that ended September 30.

This would not only push the country into the top 10, but would make China the third or fourth leading foreign market for U.S. farm products. China has climbed the market ladder at an unprecedented rate since Fiscal 1977 when Chinese imports of U.S. farm products were practically nil. Until then, trade between the two nations fluctuated considerably, depending partly on whether China's regular suppliers could meet its import needs and partly on how tightly it was trying to control imports.

In 1978, when China again opened it doors to increased foreign trade, it became American agriculture's 20th ranked customer, with sales totaling $370 million. The following year, in an atmosphere of expanding political and economic ties, U.S. sales reached $917 million, beating the previous record of $870 million in 1974 and leaving China the 12th ranked market.

NOTABLE NUMBERS

The Federal Government owns 29.7 percent of Montana's land area, the State 5.7 percent, and Indian reservations 5.6 percent. The balance, 59.0 percent is privately owned.

PASTURE AND RANGE CONDITIONS VARY

Montana pasture and range feed conditions declined 1 point during November and averaged 62 percent on December 1 compared with 66 percent on December 1, 1979.

The eastern third and southcentral areas of the State showed a November 1 to December 1 decline, while other areas were essentially unchanged or somewhat improved.

MONTANA PASTURE & RANGE FEED CONDITION DEC. 1

NOVEMBER FARM PRICES OFF SLIGHTLY

Montana farmers and ranchers received lower prices for livestock but higher prices for most crop items on November 15 compared with a month earlier. The November 1980 index of prices received by the State's farmers for all farm products at 283 (1967=100) was down nearly one percent from the revised October index, but 4 percent above November 1979. The all crops index at 316 was 4 percent above last month and 21 percent above last year. The livestock and products index at 262 was 4 percent less than last month and 7 percent below last year. In comparing November prices with October prices, increases were noted for all wheat, barley, oats, milk, and eggs. Prices went down for all hay, beef cattle, calves, sheep, lambs, hogs, and wool.

Nationally, the November index of prices received by farmers increased 5 points (1.9%) to 265 percent of its January-December 1967 average. Contributing most to the increase since October were higher prices for soybeans, corn, eggs, milk, lettuce, and wheat. Lower prices for cattle, hogs, grapefruit, broilers, tomatoes, and apples were partially offsetting. The index was 27 points (11 percent) above a year ago.

BUTTER AND ICE CREAM PRODUCTION UP

Montana dairy plants manufactured 155,000 gallons of ice cream during October--5 percent more than October 1979 but 15 percent less than September 1980. Creamed cottage cheese output at 436,000 pounds was 3 percent less than last year. Butter production at 198,000 pounds was up 13 percent from a year ago and 46 percent more than last month.

DROUGHT & HIGH INTEREST RATES AGGRAVATE FARMERS' 1980 FINANCIAL SITUATION--1981 OUTLOOK BRIGHTER

In 1980, farmers were faced with major financial problems brought about by high interest rates and tight credit in the spring and widespread drought. Farmers in drought-stricken areas will enter 1981 heavily burdened with debt because of the need to obtain extensions and renewals of existing debts. Farmers not affected by the adverse weather should be in a stronger financial situation. Interest rates are expected to remain high in 1981; however, they are expected to be lower, on average, than this year's rates.

Net farm income will be between $23 and $25 billion in 1980--down from $31 billion in 1979. However, projected higher farm prices, lower interest rates, and a decline in the rate of increase in production expenses should contribute to increased net farm income in 1981--currently forecast from $27 to $32 billion. The higher farm prices forecast for 1981 are due to a substantial drop in supplies of commodities, as well as expectations of strong export demand. Cash income from both farm and nonfarm sources rose slightly in 1980 and is expected to take a substantial jump in 1981.

As a whole, farmers are likely to be in an improved financial position by the end of 1981. However, Hog and poultry producers' incomes are expected to improve only marginally, while producers of vegetable, fruits, and nuts are forecast to have lower incomes in 1981.

MONTANA RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 4 percent less red meat during October than the same month one year ago. Total production at 16.9 million pounds compares with 17.5 million pounds last October and 15.1 million pounds in September 1980. Production for January-October 1980 at 152.3 million pounds is 16 percent more than the same period in 1979.

Commercial red meat production for the United States during October 1980 totaled 3.58 billion pounds--up 1 percent from October 1979. The January-October red meat production at 32.1 billion pounds was 4 percent above last year. The 1980 accumulated production changes by individual components were: beef, up 1 percent; veal, down 10 percent; pork, up 10 percent; lamb and mutton, up 8 percent.

Notable Numbers

In most years Choteau county leads the State in crop cash receipts followed by Hill county.

FARM EXPORTS TOP ALL FORECASTS

Ten months ago, no one would have bet that the value of U.S. agricultural exports would reach a record $40 billion in 1980, according to USDA trade analyst, Steve Milmoe.

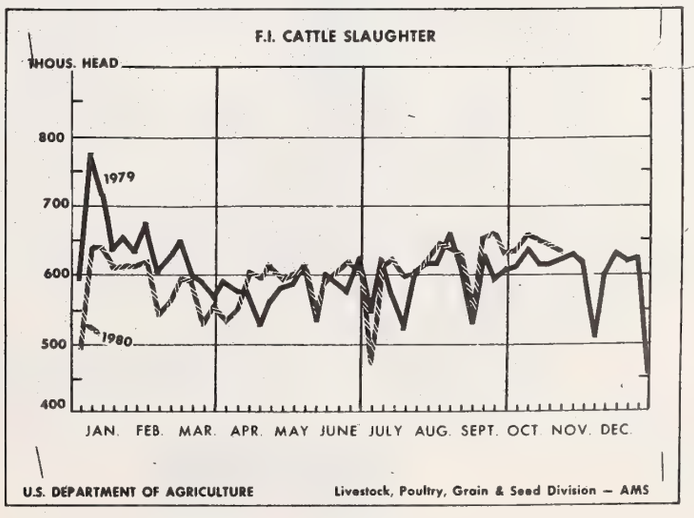
"We knew export sales would set another record. But the boycott of U.S. goods by Iran, a half-billion dollar farm market in 1979, and the partial suspension of trade with the Soviets were pessimistic signs", Milmoe says.

So last February, USDA forecasters trimmed $1 billion off expected 1980 export sales, previously pegged at $38 billion.

Instead, sales soared past the $38 billion mark--reaching an estimated $40 billion for the 1980 Fiscal Year, which ended September 30. That's a 25-percent increase from 1979's $32 billion. At the same time, U.S. export volume rose about 18 percent to 162 million metric tons.

The windfall in sales boosted the U.S. agricultural trade surplus (the value of farm goods exported minus the value imported) from 1979's $15.8 billion to a record $22.5 billion.

Reprint from the Farmline



Another Record Wheat Crop Means Alltime High Supply

The 1980 U.S. wheat crop developed through a variety of conditions—from drought to excessive rains—but the hardiness of the wheat plant was again evident as the October 1 crop estimate was a record 2.36 billion bushels, up 10 percent from last year. Chances are 2 out of 3 that this forecast will not differ from the final production by more than 35 million bushels. A 14-percent increase in harvested acreage more than offset lower yields—33.0 bushels per acre, compared with a record 34.2 bushels in 1979.

The 1980 *winter wheat* crop was planted under dry soil conditions in the Southern Plains but was followed by a mild winter which minimized freeze damage. A wet, cool spring caused late maturing of the crop and delayed the harvest, but producers garnered a record 1.88 billion bushels. The average winter wheat yield of 36.1 bushels per acre was less than a bushel short of 1979's record although there were marked regional variations. White winter wheat yields in the Pacific Northwest increased sharply, helping to produce a record crop; Hard Red Winter yields averaged slightly lower in southern areas but were record high in western regions; and eastern Soft Red yields were records in many States.

Responding to advancing 1979/80 *Durum* prices, growers upped plantings 35 percent last spring. But persistent drought in Durum areas lowered yields by 5 bushels, so on balance, the crop of 107 million bushels was virtually the same as last year. Cool, wet weather in the Northern Plains delayed the harvest causing over half of the crop to suffer sprout damage.

Growers of *other spring wheat* also increased planted acreage by 12 percent. But the same drought conditions and rain-delayed harvest turned a potential record harvest into the smallest crop in 5 years. Total production of other spring wheat consisted of 315 million bushels of Hard Red Spring and 61 million bushels of White wheat. Yields are expected to average 25.5 bushels per harvested acre, down from 28.2 bushels a year ago.

Overall, the quality of the 1980 winter wheat crop—Hard Red, Soft Red, and White—is probably the highest in many years, with increased protein levels for the hard breadmaking wheat, and optimally low protein levels for the soft pastry wheats. Quality of Durum and Hard Red spring wheats suffered widespread sprout damage while White spring was relatively unaffected.

FARM WORKERS INCREASE

The total number of workers on Montana farms and ranches during the week of October 12-18, 1980 was estimated at 34,000--31 percent above October 1979. Farm operators plus unpaid family members working 15 hours or more per week were up 65 percent from last year, but hired workers at 6,000 were down 33 percent from October 1979.

The survey week in 1979 was October 7-13. This year it was October 12-18--about a week later.

1981 LIVESTOCK PRICES AND PRODUCTION COSTS TO INCREASE SHARPLY

Livestock and poultry prices are expected to increase later this fall and throughout most of 1981, as totals meat supplies remain below year-earlier levels. However, despite prospects for much higher 1981 prices, the outlook for producers' profits has been clouded by much higher costs, particularly for feed. Sharply higher meat prices are also in store for 1981. Higher livestock and poultry prices will be necessa to enable producers to cover higher feeding costs, particularly on marketings in the second half of 1981. If livestock and poultry prices fail to cover production costs, future output may be reduced.

Total red meat and poultry supplies are expected to increase seasonally this fall, but remain below levels of a year ago. Increased fed cattle marketings this fall and winter will be further augmented by continued large nonfed cattle slaughter so beef production will likely be above year-earlier levels. Pork supplies are rising seasonally, but remain below last year's levels and the rate of decline will accelerate late this fall. Broiler producers have started to expand production in response to prospects for declining red meat supplies and higher prices. But increases in broiler output may be limited by higher production costs.

Per capita consumption of pork in 1981 may fall about 10 percent from 1980 levels, and beef consumption could be down slightly. Broiler consumption in early 1981 will about equal last year's levels and should increase throughout the remainder of the year, but not enough to offset the drop in red meat consumption. Consequently, per capita red meat and poultry consumption may decline about 2 to 4 percent in 1981.

Retail meat prices in the third quarter increased 4.5 percent from the previous quarter, but were still only 3.9 percent above the third quarter of 1979. The Consumer Price Index for pork rose 9.6 percent from the previous quarter but only 2.9 percent for beef. Declining meat supplies, rising consumer incomes, and continued high rates of inflation are likely to result in substantial increases in retail meat prices in 1981. Pork prices are expected to increase the most--perhaps 25 percent or more. Beef prices may increase 12 to 16 percent and poultry meat prices 15 to 20 percent. The sharpest price increases may begin in the second quarter as nonfed cattle slaughter slows with the beginning of the spring grazing season.

Fed cattle price gains will likely be held down through the first quarter of 1981 as the large nonfed slaughter supplements increased fed cattle marketing. Choice fed steer prices at Omaha may average in the upper $60's this fall before moving to the low $70's in the first quarter as pork supplies decline. Prices may reach $80 next spring before leveling off in the second half of 1980. Continued large feeder cattle movements and increased feeding costs will hold down feeder cattle prices through much of the first quarter. Yearling feeder cattle prices may average in the mid-to-upper $70's until late in the winter quarter before increasing to the uppper $80's as the spring grazing season begins and the forced cattle movement declines. Feeding margins are likely to be most favorable on cattle marketed in the spring quarter as a result of rising fed cattle prices and the lower prices for feeder cattle when they were placed on feed.

World Grain Supplies Tighten

FERTILIZER CONSUMPTION DROPS

Fertilizer consumption in Montana during the year ended June 30, 1980 totaled 280,463 tons, down 16 percent from the 333,834 tons consumed during the 1978-79 year. Mixed fertilizer accounted for 116,065 tons of the total, while 158,438 tons were primary nutrients and 5,960 tons were secondary and micronutrients used in direct application materials.

Fertilizer consumption in the U.S. and Puerto Rico during the year ended June 30, 1980 is placed at 52.6 million tons--up 2 percent from the 51.5 million tons consumed during the 1978-79 year. Primary nutrient content (nitrogen, N; phosphate, P_2O_5; and potash K_2O) was 23.0 million tons--up 2 percent from a year earlier. Nitrogen consumption increased 6 percent to 11.4 million tons; phosphate usage decreased 4 percent to 5.4 million tons; and potash at 6.2 million tons was down 1 percent.

The five leading States in order of total consumption and the change in consumption from last year were: Illinois--up 7 percent; California--up 11 percent; Iowa--down 1 percent; Texas--up 7 percent; and Indiana--down 3 percent.

Fertilizer consumption represents all commercial fertilizer tonnage sold or shipped for farm and non-farm use as fertilizer. Materials used in the manufacture of registered mixes or for use in other fertilizers are excluded.

Notable Numbers

In 1979, Beaverhead county lead the State in livestock and livestock products cash receipts followed very closely by Yellowstone.

RAIN HELPS PASTURES AND RANGES

Montana range and pasture feed conditions improved in October as snow and rain replenished topsoil moisture. The condition as of November 1 averaged 63 percent--up 4 points from October 1, but still 5 points below last year at this date. In the drought-stricken northeast corner, no improvement over last month was noted and the central region showed a 4-point decline.

OCTOBER PRICES UP SLIGHTLY

The October 1980 index of prices received by Montana farmers and ranchers for all farm products was 290 (1967=100) compared with 284 a month earlier and 289 for October 1979. The all crops index at 310 was 6 percent above last month and 15 percent above last year. The livestock and products index at 278 was down slightly from last month and down 9 percent from last year. Price increases were noted for all items except cows, calves, sheep, and eggs. Calves on October 15 were 17 cents a pound under last year prices, while hogs were up almost 12 cents.

The U.S. October index of prices received by farmers increased 1 point (.4 percent) to 262 percent of its January-December 1967 average. Contributing most to the increase since September were higher prices for milk, oranges, wheat, hogs, soybeans, and grapefruit. Lower prices for potatoes, cotton, apples, eggs, lettuce, and tobacco were partially offsetting. The index was 26 points (11 percent) above a year ago. The index of prices paid by farmers for commodities and services, interest, taxes and wage rates for October 15 was 288--up 2 points (.7 percent) from mid-September. Higher prices for replacement livestock, feed, and family living items were the major contributors to the increase. The index for October was 31 points (12 percent) higher than a year earlier.

PROSPECTS FOR 1980 SOVIET CROP DOWN SHARPLY

Recent statements by Soviet officials point to a disappointing 1980 grain crop--probably not much better than last year's outturn of 179 million tons. Although these statements were made earlier than normal, especially in light of the slow and difficult harvest, such statements in the past have generally approximated the size of the final crop. Accordingly, USDA has revised its estimate downward to 185 million tons from the 205 million tons estimated in the October circular. The wheat crop is now estimated at 90 million tons; coarse grains at 85 million tons and miscellaneous grains and pulses at 10 million tons. The estimate of total grain area has been reduced to 126 million hectares compared with 127 million in October--reflecting late-season harvesting difficulties.

A crop estimate of 185 million tons suggests lodging and harvest losses were much higher than earlier thought. In addition, heavy rains at harvest probably resulted in some grain fields being abandoned or harvested for forage, and may have resulted in some grain that had been windrowed (but not yet threshed) going out of condition.

Reprint from Foreign Agricultural Circu

ICE CREAM PRODUCTION DOWN

Montana dairy plants manufactured 182,000 gallons of ice cream during September--26 percent more than September 1979 but 2 percent less than August 1980. Creamed cottage cheese output at 430,000 pounds was 17 percent more than last year. Butter production at 136,000 pounds was up 16 percent from a year ago and 18 percent from August 1980.

WORLD GRAIN SUPPLIES TIGHTEN--PRICES TO STRENGTHEN

Because of further deterioration in world crops and continued strong export demand, prices for feed grains and oilseeds are likely to be stronger than earlier expected. Although world grain production is forecast up slightly for 1980/81, this will not offset the 12 percent smaller stocks carried into the marketing year. In early October, total world grain supplies for 1980/81 were estimated at 1.61 billion metric tons--down slightly from last year's supply of 1.62 billion. World cotton supplies remain tight as the smaller U.S. crop has reduced total world supplies for 1980/81 by about 3 percent from a year earlier.

World trade and use of grains are expected to set records in 1980/81, with ending stocks likely to be down around 20 percent from the 192.5 million tons on hand at the end of 1979/80. However, since earlier October, indications are that grain production prospects in the Soviet Union, Argentina, and Australia may have deteriorated. If this is the case, the world grain supply situation may be even tighter than these latest figures indicate. Next year's carryover stocks will decline to about 10½ percent of use--the same tight relationship that stocks bore to world use at the end of the 1974/75 marketing year, when the stock/use ratio reached the lowest level of the 1970's.

The improved farm prices of the second half of 1980 will offset the lower prices of the first half, leaving average prices received by farmers slightly higher than last year. However, total cash receipts may be up 6 to 7 percent--mainly because of larger marketings. Farm inventories of corn, soybeans, cotton, and hogs are being reduced. Net farm income in 1980 (after inventory adjustment) is still expected to fall within a range of $23 to $25 billion--down 20 to 25 percent from 1979. Before inventory adjustment, net farm income in 1980 will be down less than 10 percent from 1979.

Prospects for higher crop and livestock prices in 1981 indicate a brighter farm income situation, as cash receipts will likely rise more than costs. Thus, net farm income in 1981 is expected to increase significantly--possibly recouping all of this year's decline.

MILK PRODUCTION UP

Montana milk production during the third quarter (July-September) of 1980 was 8 percent above the same quarter last year. The increase in production is due to the addition of about 2,000 cows to the milking herd since last year. The 29,000 cows in the State produced 82 million pounds of milk in the period July-September. Dairymen fed an average of 12 pounds of grain and concentrates per day to all cows in the herd on October 1.

2/ Excludes milk sucked by calves.

MONTANA LIVESTOCK SLAUGHTER DOWN

Montana slaughter plants produced 1 percent less red meat during September than the same month one year ago. Total production at 15.1 million pounds compares with 15.2 million pounds last September and 15.3 million pounds during August 1980. Production for January to September 1980 at 135.5 million pounds is 19 percent more than the same period one year ago.

Commercial red meat production for the United States during September 1980 totaled 3.22 billion pounds--up 12 percent from September 1979. January-September red meat production at 28.6 billion pounds was 5 percent above last year. The 1980 accumulated production changes by individual components were: beef, up less than 1 percent; veal, down 11 percent; pork, up 12 percent; lamb and mutton, up 8 percent.

CATTLE ON FEED NUMBERS UP

Cattle and calves on feed on October 1 in Montana feedlots for the slaughter market totaled 39,000 head--this is 22 percent more than last October but 20 percent less than the number being fed on July 1. This is the largest number on feed October 1 in the last 3 years and the smallest seasonal decline from July 1 since 1976. Steers on feed at 17,000 head are up 21 percent from last October and heifers at 22,000 head are up 29 percent. About 90 percent of all steers and heifers on feed weighed 700 pounds or more, 49 percent weighed 900 pounds or more. PLACEMENTS in lots during the July-September period totaled 16,000 head--up 45 percent from the same period last year. Montana feeders expect to market 24,000 head during the October-December period--33 percent more than the same period in 1979.

In the 23 major feeding States, cattle and calves on feed for slaughter market totaled 9.99 million head. The number on feed was virtually unchanged from 1979 but 12 percent less than on October 1, 1978. PLACEMENTS during the July-September quarter totaled 6.41 million--an increase of 8 percent over the same quarter last year but 13 percent less than the third quarter of 1978. MARKETINGS of fed cattle for slaughter during the July-September quarter totaled 5.75 million--down 4 percent from the comparable quarter in 1979 and 12 percent less than 1978.

OCTOBER GRAIN STOCKS HIGHER

Stocks of wheat in Montana on October 1, 1980 in all storage positions totaled 170.0 million bushels--up 1 percent from a year ago. A slightly higher proportion of this year's production is still on hand compared with a year earlier. Wheat stored on farms accounted for 85 percent of the total with the remainder in commercial storage. This includes wheat in the reserve, under loan, and "free". Disappearance of wheat since June 1 totaled 22.6 million bushels--37 percent less than a year ago.

Winter wheat in storage at 85.4 million bushels was down 2 percent from last year, but all spring wheat at 84.6 million bushels was up 4 percent with the durum portion at 9.4 million down 18 percent. Barley stocks in all positions at 45.7 million bushels were down 12 percent and oats at 5.6 million were down 28 percent.

Nationally, all wheat stocks in all storage positions as of October 1, 1980 totaled 2.47 billion bushels--9 percent larger than last year. Farm storages contained 972 million bushels of wheat--39 percent of the total October 1, 1980 stocks, while the remainder in off-farm storage amounted to 1.49 billion bushels. Last year, farm storages held 1.03 billion bushels and off farm storage had 1.24 billion bushels. Durum wheat stocks on October 1, 1980 totaled 122 million bushels--20 percent less than last year.

ALFALFA SEED PRODUCTION UP

Montana's 1980 alfalfa seed crop is forecast at 4.0 million pounds--down 31 percent from last year's crop. Acres for harvest at 35,000 are down 17 percent and yield per acre at 115 pounds is down 25 pounds from 1979. Dry weather in much of the main producing areas of eastern Montana put increased emphasis on hay production rather than seed and also reduced seed yields.

NOTABLE NUMBERS

All major winter wheat states, except Montana, Oklahoma and Texas, had larger winter wheat crops in 1980 than in 1979.

SWEET CHERRY CROP SMALLER

The 1980 sweet cherry production in Montana totaled 700 tons compared with 2,950 tons last year. This is the smallest crop since 1969 when production was 610 tons. Much of the crop was damaged by rain and hail just a few weeks before harvest. The crop was valued at $377,000, considerably less than last years $2,012,000 crop. Average price received by growers dropped to $539 per ton compared with $682 in 1979.

The Nation's sweet cherry crop totaled 164,300 tons in 1980, 11 percent below the record crop of 184,000 tons last year. The crop was valued at 106 million dollars, 4 percent less than in 1979. Growers received an average of $649 per ton, up from $601 last year.

Washington, the leading producing state, had 45,000 tons. California, in second place, produced 43,500 tons. Oregon, in third and Michigan in fourth place, produced 32,000 and 29,000 tons respectively. These four states produced 91 percent of the total crop this year.

TRACTOR SHIPMENTS CONTINUE DOWN

The Bureau of the Census reports wheel-type tractor shipments from factories totaled 48,992 during April-July 1980--down 32 percent from the same period in 1979 and 12 percent below April-July 1978.

Tractor shipments have been down each month since February this year. During this 6-month (Feb.-July) period, only 80,626 wheel-type tractors were shipped--30,597 fewer than in 1979.

Dealer inventories must be large and/or sales down.

PASTURE AND RANGE CONDITIONS POOR

Montana ranges and pastures showed slightly more than the seasonal decline during September. The October 1 condition was 59 percent--5 points below last month and 7 points below last year.

September rains helped sustain feed supplies but the benefit was limited because many grasses had entered seasonal dormancy. Late season grasses greened up in many areas but growth was limited.

OCTOBER 1 CROP PRODUCTION HIGHLIGHTS

Montana's 1980 wheat crop based on an October 1 survey is expected to total 117.2 million bushels--1 percent above last year. The forecast is slightly below the September 1 forecast because of reduced durum prospects. The first part of September was not an ideal time for harvesting, as showers frequently held up combining. However, toward the latter part of the month, better weather prevailed and harvest of all small grains was nearing completion.

Montana's winter wheat production at 57.2 million bushels is essentially un-changed from a year ago, hard spring wheatat 53.6 million bushels is up 2 percent, durum at 6.5 million bushels is down 5 percent, barley at 45.4 is up 12 percent, and oats at 3.9 is down 29 percent.

The season's first production forecast for potatoes indicates a total of 1,633 thousand hundredweight-down 9 percent--mainly due to fewer acres for harvest. Other crop forecasts are: sugarbeets with 844 thousand tons--up 2 percent from year-ago levels; dry beans, 195 thousand hundredweight--up 11 percent; corn for grain at 450 thousand bushels--up 17 percent, and all hay at 4,100 thousand tons, off 4 percent.

Nationally, corn production is forecast at 6.47 billion bushels (164 million metric tons)--1 percent below the September 1 forecast, and 17 percent below the record crop produced a year ago. Feed grain production (corn, sorghum, oats, and barley combined) is expected to total 192 million metric tons-- 18 percent less than last year. Wheat production is forecast at 2.36 billion bushels on October 1--up slightly from September 1 and up 10 percent from last year.

SEPTEMBER PRICES HIGHER

Montana farmers and ranchers received slightly higher prices for their products on September 15 compared with a month earlier. The index of prices received at 282 (1967=100) was 3 percent above a month ago but 4 percent lower than mid-September a year ago. The prices received index for crops at 292 was 3 percent higher than last month and 12 percent above a year ago. During September, prices were higher for all crops except winter wheat and barley--barley prices declined 5 cents per bushel, while winter wheat prices remained unchanged from a month ago. The livestock index at 277 was 3 percent above last month but 13 percent below last year. Prices were generally higher for all livestock items except sheep and hogs.

For the nation, the September index of prices received by farmers increased 5 points (1.9 percent) to 261 percent of its January-December 1967 average. Contributing most to the increase since August were higher prices for soybeans, corn, milk, oranges, lettuce, and eggs. Lower prices for apples, cattle, potatoes, lemons, hogs, and tomatoes were partially offsetting. The index was 21 points (8.8 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for September 15 was 286--up 3 points (1.1 percent) from mid-August. Higher prices for feed, seed, feeder livestock and farm equipment were the major contributors to the increase. The index for September was 31 points (12 percent) higher than a year earlier.

Ratio 2/	69	67	94	91

1/ Mid-month Index. 2/ Ratio of Index of Prices Received by Farmers to Index of Prices Paid, Interest, Taxes and Farm Wage Rates.

ICE CREAM PRODUCTION DOWN

Montana dairy plants manufactured 186,000 gallons of ice cream during August--14 percent less than August 1979 and 16 percent less than July 1980. Creamed cottage cheese output at 468,000 pounds was 4 percent less than last year. Butter production at 115,000 pounds was up 13 percent from a year ago and 3 percent from July 1980.

LOWER RED MEAT AND POULTRY OUTPUT EXPECTED IN COMING MONTHS

During the rest of 1980, supplies of pork, broilers, and eggs will fall short of year-earlier levels as production cutbacks planned earlier in the year--plus the impact of this summer's heat and drought--begin to take effect. Beef production, on the other hand, will be slightly higher than last year.

The September 1 inventory of hogs and pigs (in the 14 major producing States) showed market hog numbers down 2 percent from last year, but still 15 percent larger than in 1978. Farrowings during June-August and farrowing intentions for September-November were both down 10 percent, implying that pork production in the first half of 1981 will fall substantially below year-ago levels.

Farm commodity prices have been rising much faster than input prices in recent months, thus improving farm income prospects for 1980 relative to earlier expectations. The index of prices received by farmers gained 12 percent from June to September, while the index of prices paid rose only 3 percent. Despite this improvement, prices paid by farmers were up 12 percent from a year ago in September, while prices received were up 9 percent. Higher feed prices have continued to squeeze livestock producers' margins. In addition farmers who lost most or all of their crops to this summer's drought and heat will not share in the improved income situation.

With improved market conditions, total feed grains have shown net movement out of the farmer-owned reserve in recent months. Corn, which is in release status, has shown the largest absolute drop in farmer-owned reserves, while oats, which are in call status, have shown the largest percentage drop. Barley is the only feed grain for which net movement has been into the reserve. Wheat has been moving into the reserve in recent weeks, although at a slow pace.

Retail food prices, as measured by the Consumer Price Index (CPI-U), increased 1.5 percent in August--the largest monthly rise since February 1979. The major contributors to the August increase were poultry, pork, beef, and fresh fruit. With food prices having risen relatively slowly in the first half of 1980, the total gain this year is expected to be about 9 percent--the smallest increase since 1977.

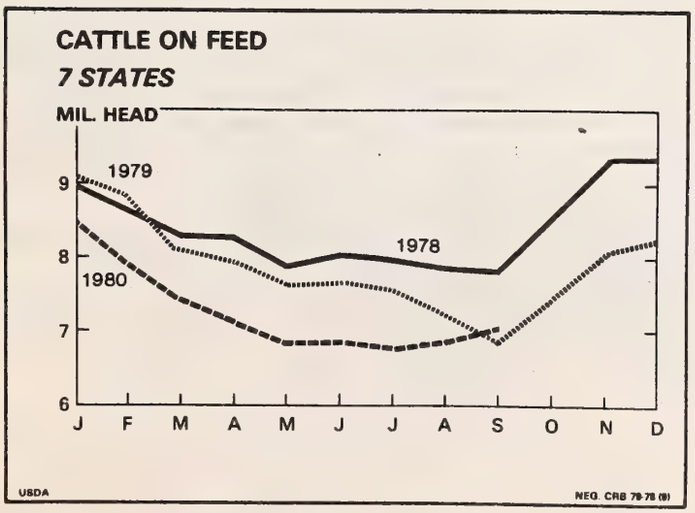
NOTABLE NUMBERS

Farm production expenditures in 1979 were 9 percent above 1978--the largest annual percentage increase since 1973.

CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed September 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.05 million head--up 3 percent from last year but 10 percent fewer than September 1, 1978. September marked the first time in 18 months that numbers on feed were higher than the corresponding year earlier totals. MARKETINGS of fed cattle during August totaled 1.40 million--down 14 percent from last year and 16 percent from August 1978. This is the lowest number of August marketings from the 7 States since 1975. PLACEMENTS of cattle and calves on feed in the 7 States during August were 1.62 million--a 20 percent increase from last year but 8 percent less than August two years ago. NET PLACEMENTS of 1.56 million were 23 percent more than August last year but 5 percent below August 1978. OTHER DISAPPEARANCE during August totaled 61 thousand head compared with 82 thousand during August 1979 and 115 thousand in 1978.



HOG AND PIG INVENTORY DOWN

Inventory of hogs and pigs on September 1, 1980 in the 14 States conducting quarterly hog surveys is estimated at 55.6 million head--3 percent below last year, but 13 percent above 1978.

--Breeding inventory at 7.45 million head, 10 percent less than a year ago and virtually unchanged from two years earlier.

--Market hog inventory at 48.1 million head--2 percent less than last year but up 15 percent from 1978.

This summer's high temperatures across much of the major hog producing areas slowed weight gains of market hogs. Death losses were also above a year ago.

The 14 Quarterly States account for about 84 percent of the U.S. hog and pig inventory.

PIG CROP (June-August 1980)--The June-August 1980 pig crop in the 14 States totaled 20.5 million head--10 percent less than 1979 but 7 percent above 1978. A total of 2.85 million sows farrowed in these States--down 10 percent from last year. Pigs saved averaged 7.17 for the quarter compared with 7.16 pigs per litter for the same quarter last year.

FARROWING INTENTIONS--Producers in the 14 States intend to farrow 2.74 million sows during the September-November 1980 period--10 percent less than 1979. Farrowing intentions reported for the December 1980-February 1981 period are 2.56 million sows--a decrease of 7 percent from the same period a year ago.

AUGUST RED MEAT PRODUCTION DROPS

Montana slaughter plants produced 7 percent less red meat during August than the same month one year ago. Total production at 15.3 million pounds compares with 16.4 million pounds last August and 15.2 million pounds in July 1980. Production for January-August 1980 at 120.4 million pounds is 21 percent more than the same period in 1979.

Commercial red meat production for the United States in August 1980 totaled 3.02 billion pounds--down 9 percent from August 1979. January-August red meat production at 25.3 billion pounds was 4 percent above last year. The 1980 accumulated production changes by individual components were: beef, down 1 percent; veal, down 14 percent; pork, up 12 percent; lamb and mutton, up 8 percent.

U.S. FARM POPULATION--1979

The number of persons living on U.S. farms averaged 6,241,000 in the 12-month period centered on April 1979. 1/ This is about 260,000 lower than the estimate of 6,501,000 for 1978, but such a decrease is statistically insignificant; the chances are about 1 out of 15 that a decline of this magnitude would have been obtained from the sample without any real change in the farm population between 1978 and 1979. The U.S. farm population estimate for 1979 was also not significantly different from that of 6,194,000 for 1977.

These estimates are based on the new definition of a farm, first introduced into farm population statistics in 1978. Under this definition, the farm population consists of persons living in rural territory on places that sold, or normally would have sold, $1,000 or more of agricultural products in the reporting year. The previous definition, in use since 1960, defined the farm population as all persons living in rural territory on places of 10 acres or more with at least $50 worth of agricultural products sold, and places of under 10 acres with at least $250 worth of agricultural products sold.

A related report issued jointly by the Bureau of the Census and the U.S. Department of Agriculture noted that the change in definition had the following effects on the 1978 farm population estimates: 2/

* There was a substantial reduction (1.5 million) in the number of persons counted as living on farms.
* The demographic and social characteristics of the farm population were not significantly altered.
* The population reclassified from rural farm to rural nonfarm was primarily white, older, and less likely to be in the labor force or, if in the labor force, were supported chiefly by off-farm work.

1/ The estimate of the U.S. farm population is an annual average computed by using quarterly data for the year centered on the April date for which the estimate is prepared. In this case, quarterly estimates for October 1978 and January, April, July, and October 1979 were used with a weight of one-eighth given to each of the two October estimates and a weight of one-fourth to each of the estimates of the other 3 months.

2/ Banks, Vera J., and Diana DeAre. Farm Population of the United States: 1978. Current Population Reports, Series P-27, No. 52. U.S. Bureau of the Census and U.S. Department of Agriculture, cooperating. 1979.

TIGHTER SUPPLIES IN PROSPECT FOR FEED GRAINS, COTTON, AND OILSEEDS

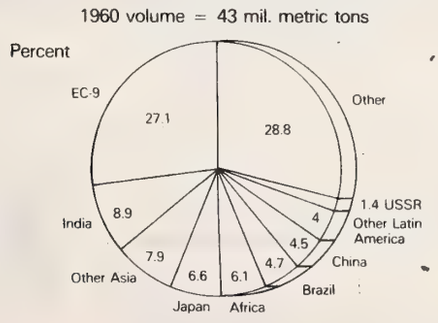
This summer's hot, dry weather has cut 1980 crop production, reducing 1980/81 supplies of feed grains, cotton, and oilseeds. With tighter supplies and relatively strong demand, prices of farm commodities have risen sharply; prices received by farmers for all farm products climbed 10 percent from June to August, although it was up only 7½ percent from a year earlier. Despite the gains in livestock and poultry prices, higher feed prices will again squeeze feeding margins this fall.

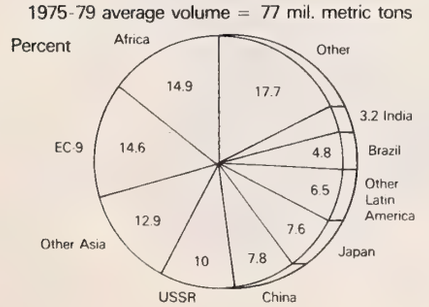
Although net farm income in 1980 will still be down significantly from 1979, the income picture has improved from the first half of the year due to sharp summer advances in crop and livestock prices. Net farm income is now forecast to be $23 to $25 billion this year--down 20 to 25 percent from 1979. Much of this decline is due to the large change in inventories from 1979 to 1980. As a result, net farm income before inventory adjustment and on a cash income basis (excluding inventories and non-cash income and expenses) will decline about half that much.

The first detailed 1979 farm income statistics have recently been completed. These estimates incorporate recent data from the Farm Production Expenditures Survey plus an update of 1979 cash receipts. As a result, net farm income for 1979 is now estimated at $31 billion--down from the earlier forecast of $33.3 billion. Total cash receipts were only slightly higher than earlier estimated, but production expenses increased an estimated 18 percent instead of the 16 percent forecast earlier.

U.S. agricultural exports likely will hit $40 billion in Fiscal 1980. The present export strength is expected to carry over into Fiscal 1981. With slightly larger volume and higher prices, the value of exports in Fiscal 1981 could range from $40 to $45 billion.

Shifts in the World Wheat Import Market





EGG PRODUCTION INCREASES

Montana's laying flocks produced 47 million eggs during the June-August quarter--up 4 percent from the same period a year ago. The average number of layers on hand during the quarter at 758,000 was down 1 percent from the same quarter a year ago.

The nation's laying flocks produced 17,029 million eggs during the same quarter--down 1 percent from last year. The number of layers during the quarter averaged 281.7 million--down 1 percent from the same quarter a year ago.

POTATO PRODUCTION AND UTILIZATION

Potato producers in Montana sold 1,540,000 cwt. of potatoes from the 1979 crop--12 percent less than the previous year. Producers sold 86 percent of the 1,800,000 cwt. produced in 1979. Shrinkage and loss accounted for 8 percent and 6 percent were used for seeding the 1980 crop and other uses on the farms where produced.

Value of production at $6,480,000 was 22 percent less than the 1978 crop and value of sales at $5,544,000 dropped 21 percent from the previous year. Average price for the 1979 crop sales was $3.60--down 40 cents from the previous year.

The nation's 1979 potato crop totaled 343 million cwt.--6 percent less than the record 1978 crop and 3 percent below the 1977 output. With the decline in production, total value of the nation's 1979 crop fell 4 percent to 1,174 million dollars. The average 1979 price received per cwt. at $3.43 compares with $3.38 for the 1978 crop.

Total sales for the U.S. from the 1979 potato crop of 307 million cwt. were 6 percent below the 325 million cwt. sold a year earlier, and 3 percent below the 1977 crop sales. Sales for processing accounted for 48 percent of total production; fresh market sales accounted for 34 percent and other sales totaled 7 percent. Use of potatoes on farms where produced and shrinkage accounted for the remaining 11 percent of the 1979 production.

WHERE DO THE FIGURES COME FROM?

Every agricultural crop and livestock estimate that you see in the "Montana Crop and Livestock Reporter" originates from the farm, ranch, or related business. Many readers are well aware of that fact, having faithfully reported their individual farm data over a period of many years.

Each fall, at the close of the harvest season, an acreage and production survey is conducted by the Montana Crop and Livestock Reporting Service. It is the major farm survey of the year to obtain final 1980 State data on acreage, yield and production. This survey also forms the basis for county estimates of crop production. Similar surveys will be conducted in other States and final State and national estimates will be published.

Questionnaires for this year's survey will go to nearly 12,000 Montana farmers and ranchers and will be mailed the latter part of October.

In 1979 Capital Investment per worker in agriculture was $174,000 compared with $78,000 per production worker in manufacturing.

PASTURES AND RANGES IMPROVE SLIGHTLY

Montana pastures and ranges improved during August as beneficial rains and cool temperatures prevailed over much of the State.

The September 1 condition was up 1 point from August 1, but 5 points below last year on the same date. The small change in the State average was the result of deteriorating conditions in the central and southcentral regions --offsetting considerable improvement in other areas.

1981 LIVESTOCK PREVIEW

Despite the drought in many areas, the cattle industry is now entering a period of more favorable supply and demand factors.

Large year-to-year increases in total red meat and poultry supplies began late in the second quarter of 1979, forcing meat prices lower. Supplies started to ease this summer and will continue to ease throughout 1981.

The major shocks of the current recession occurred prior to and during the second quarter of this year. Some economic indicators will remain negative, but consumer incomes--a primary factor determining meat demand--slowed markedly in the second quarter and are expected to increase during the second half of this year and throughout 1981.

Large financial losses during the last half of 1979 and throughout the first half of 1980 reduced feedlot placements and caused hog and poultry producers to cut back production plans. Poultry production has already dropped below year-earlier levels, where it's expected to remain until next spring.

Pork production is slowing and while it may reach record levels in early fall, it's expected to be below year-earlier levels late in the year and throughout 1981.

Sharply higher grain prices, which have reduced the uncertainty of selling grain in the cash market, are expected to contribute to lower total meat production in 1981--especially pork produced on smaller crop-livestock farms.

Reduced meat production from last year's levels and stronger demand factors suggest livestock, poultry, and meat prices will increase during the second half of this year and into 1981.

SEPTEMBER 1 CROP PROSPECTS IMPROVE

Montana's important grain crops were helped by cool weather and scattered showers during August. Although rains fell over much of the drought-stricken areas of eastern Montana during August, they were generally too late to have as much impact on yields as occurred in the northcentral part of the State. However the much-needed rains hampered harvesting and progress at the end of August was lagging behind normal. About 75 percent of the winter wheat, 45 percent of the spring wheat, and 50 percent of the oats and barley was harvested by the end of the month. Normal harvesting progress for the end of August is 85 percent for winter wheat, 55 percent for spring wheat and oats, and 50 percent for barley.

Montana's 1980 all wheat crop is expected to total 117.6 million bushels--up 1 percent from last year. The forecast is 6 percent above the August 1 forecast because of increased prospects for all classes. Winter wheat production at 57.2 million bushels is essentially unchanged from last year, hard spring wheat at 53.6 million is up 2 percent, and durum at 6.8 million is about the same as last year. The State's barley crop is forecast at 45.4 million bushels--up 12 percent from last year, but oats production at 3.9 million is off 25 percent from 1979.

Nationally, all wheat production is forecast at a record high 2.35 billion bushels (64.1 million metric tons)--10 percent more than last year. Durum production is down 4 percent, other spring, down 13 percent, and winter wheat production up 17 percent from last year.

FARM PRICES UP

Montana farmers and ranchers received higher prices for their products on August 15 compared with a month earlier. The index of prices received for all farm products at 270 (1967=100) was 3 percent higher than a month ago and 6 percent higher than mid-August a year ago. The prices received index for crops at 291 was 1 percent over last month but 20 percent above a year ago. Higher prices were received during August for all crops except winter wheat and oats. The livestock index at 257 was 5 percent above last month but 3 percent below last year. All livestock items except sheep and lambs registered price increases during the month. Wool remained unchanged.

For the nation, the August index of prices received by farmers increased 9 points (3.6 percent) to 256 percent of its January-December 1967 average. Contributing most to the increase since July were higher prices for hogs, cattle, corn, eggs, potatoes and soybeans. The index was 18 points (7.6 percent) above a year ago. The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for August 15 was 284--up 4 points (1.4 percent) from mid-July. Higher prices for feed and feeder livestock were the major contributors to the increase. The index for August 1980 was 33 points (13 percent) higher than a year earlier.

ICE CREAM OUTPUT HIGHER

Montana dairy plants manufactured 222,000 gallons of ice cream during July--5 percent more than July 1979 and 18 percent more than June 1980. Creamed cottage cheese output at 493,000 pounds was 4 percent more than last year. Butter production at 112,000 pounds was up 7 percent from a year ago, but down 7 percent from June 1980.

CROP PRODUCTION COSTS TAKING BIG BITE

USDA's latest cost-of-production report on 10 major U.S. crops (corn, sorghum, barley, oats, wheat, rice, soybeans, flaxseed, peanuts, and cotton) gives final figures for 1978, preliminary data for 1979, and projections for this year.

For all wheat, costs were pushed up mainly by higher fuel, fertilizer, seed, and machinery prices. Per-acre costs for all wheat rose 20 percent, while costs per bushel increased 10 percent despite a large increase in yields. National average costs last year stood at $89 an acre and $2.74 a bushel.

For the different classes of wheat, average costs in 1979 were: hard red winter, $82.48 an acre and $2.51 a bushel; soft red winter, $111 an acre and $2.74 a bushel; durum, $83 an acre and $3.33 a bushel; hard red spring, $82.50 an acre and $3.16 a bushel; and white, $120.47 an acre and $2.95 a bushel.

Hard red winter wheat accounted for 51 percent of the total U.S. wheat crop last year.

Barley growers in all regions faced higher costs per acre in 1979. Costs ranged from $1.54 in the southwest to $91 in the Northern Plains, where 49 percent of last year's crop was grown. Per-acre costs were up 17 percent nationwide from 1978.

Despite a record average U.S. yield of 48 bushels per acre, the cost of producing a bushel of barley still rose 12 percent to $2.26. Dramatic yield gains in the Southern Plains and southwest helped bring costs per bushel down somewhat in those regions, although costs rose in all others.

The Southern Plains had the lowest cost per bushel last year at $2.00, while the Northern Plains, which had the lowest cost in 1978, had the second lowest cost at $2.09

At $2.87, costs per bushel were highest in the southwest, where most of the barley is grown under irrigation.

Production Costs For Major Crops Rise Sharply[1]

	1978	1979[2]	1980[3]	1978 to 1979	1979 to 1980
	dollars per unit[4]				
Corn (bu.)	1.49	1.59	2.00-2.35	+ 7	+26-48
Sorghum (bu.)	1.82	1.94	2.52-3.01	+ 7	+30-55
Barley (bu.)	2.01	2.26	2.85-3.26	+12	+26-44
Oats (bu.)	1.46	1.65	1.92-2.21	+13	+16-34
Wheat (bu.)	2.48	2.74	3.31-3.79	+10	+21-38
Rice (cwt.)	6.24	6.84	8.30-8.87	+10	+21-30
Soybeans (bu.)	3.39	3.59	4.37-4.89	+ 6	+22-36
Flaxseed (bu.)	4.61	5.35	7.26-10.34	+16	+36-93
Peanuts (lb.)	0.14	0.16	0.20-0.21	+14	+25-31
Cotton (lb.)	0.67	0.60	0.72-0.88	- 10	+20-

[1] Nonland costs only. [2] Preliminary. [3] Projected. [4] Unit costs projected for 1980 reflect a yield range based on 15-year trend yields. Yields of most crops are expected to fall in 1980 from last year's levels—down 10 percent for corn, 12 percent for sorghum, 9 percent for barley, 2 percent for oats, 5 percent for all wheat, 6 percent for soybeans, 24 percent for flaxseed, and 11 percent for cotton. Yields for rice and peanuts are expected to show little change from 1979.

NOTABLE NUMBERS

National hay production for 1980 forecast at 124 million tons is down 15 percent from 1979 and the second lowest since 1968.

LIVESTOCK SLAUGHTER INCREASES

Montana slaughter plants produced 7 percent more red meat during July than the same month one year ago. Total production at 15.2 million pounds compares with 14.1 million pounds last July and 15.2 million pounds during June 1980. Production for January - July 1980 at 105 million pounds is 28 percent more than the same period one year ago.

Commercial red meat production for the United States in July 1980 totaled 3.1 billion pounds -- up 4 percent from July 1979. January - July red meat production at 22.3 billion pounds was 6 percent above last year. The 1980 accumulated production changes by individual components were: beef, down less than 1 percent; veal, down 14 percent; pork, up 15 percent; lamb and mutton, up 9 percent.

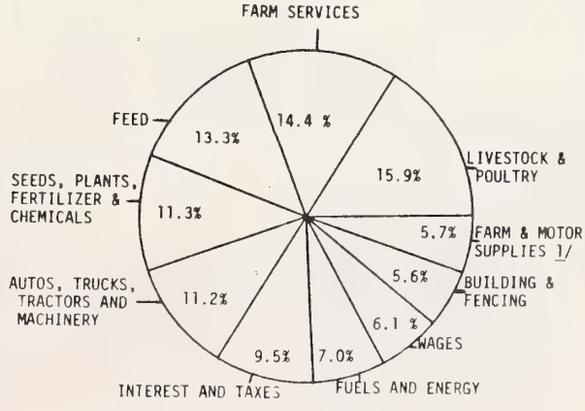
U.S. FARM PRODUCTION EXPENDITURES UP

Farm production expenditures during 1979 totaled $135.1 billion, up 18 percent from the $114.2 billion level of 1978. This was the largest percentage increase since 1973. The average expenditure per farm was $58,049 in 1979, compared with $48,273 in 1978. Livestock and poultry at $21.5 billion were the largest expenditure group, accounting for 16 percent of the total. Farm services expenditures totaled $19.4 billion or 14 percent of the total; feed purchases accounted for $18.0 billion or 13 percent; seeds, plants, fertilizer and agricultural chemicals, $15.5 billion and 11 percent; followed by motor vehicles and farm machinery, $15.2 billion and 11 percent.

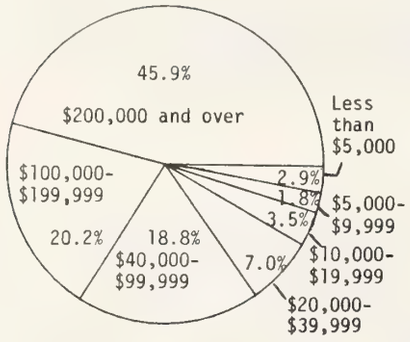
1979 EXPENDITURES AS % OF TOTAL



1/ INCLUDES .2% OF UNALLOCATED EXPENSES.

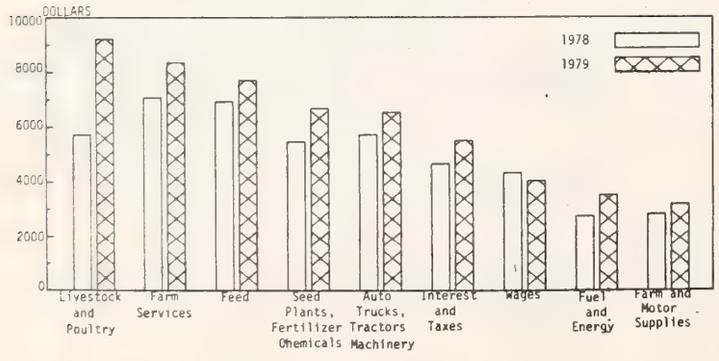
Those farms reporting gross sales of at least $200,000 accounted for only 7 percent of all farms, but 46 percent of total farm expenditures. Farms with gross sales of $100,000 to $199,999 totaled 16 percent of all farms with 20 percent of all expenses. Farms with sales of $40,000 to $99,999 accounted for 19 percent of all farms and had 19 percent of expenditures. Farms with sales less than $5,000 totaled 28 percent but had only 3 percent of the expenditures.

PERCENT OF 1979 EXPENDITURES
BY GROSS VALUE OF SALES



The average expenditures per farm for livestock and poultry increased 61 percent from a year earlier due almost entirely to higher cattle prices. Fuel and energy expenses increased 28 percent, largely because of price gains for diesel fuel and gasoline. Seed, plants, fertilizer and chemical expenditures increased 22 percent from 1978. Farm services rose nearly 18 percent. Expenditures for motor vehicles and farm machinery were 14 percent above those for 1978, while feed expenses were up 11 percent.

AVERAGE EXPENDITURES PER FARM



FARM LABOR DOWN

The total number of workers on Montana farms and ranches during the week of July 6-12, 1980 was estimated at 42,000--compared with 43,000 in July 1979. Farm operators plus unpaid family members working 15 hours or more per week were down 3 percent from last year while hired workers remained the same as last year at 11,000.

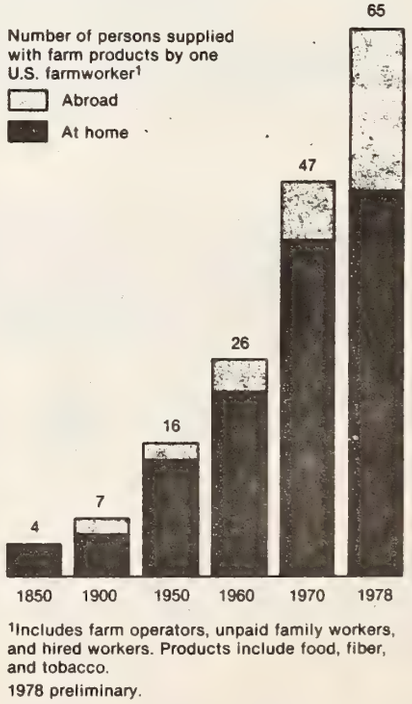
U.S. Farmer Supplies Many Here and Abroad



[1]Includes farm operators, unpaid family workers, and hired workers. Products include food, fiber, and tobacco.
1978 preliminary.

How Inflation Hurts Farmers

The recent slowdown in the rate of inflation throughout the economy is good news to farmers. It's easy to see why.

If your net farm income in 1975 was:	. . . to keep up with past inflation, you'd have to net this much this year:[1]	. . . and this much in 1985 if prices kept rising at the 1975-80 rate:[1]
$5,000	$7,080	$10,030
$10,000	$14,160	$20,050
$15,000	$21,240	$30,080
$20,000	$28,320	$40,100
$25,000	$35,400	$50,130
$30,000	$42,480	$60,150
$40,000	$56,640	$80,200
$50,000	$70,800	$100,250
$100,000	$141,600	$200,510

[1]Based on inflation throughout the general economy as measured by the GNP implicit price deflator.

Here's how prices of some of your farm production items have increased since 1975:

Diesel Fuel

July 1975 — 40 cents gal.
June 1980 — $1.00 gal.
Up 150%

Diammonium Phosphate 18-46-0

April 1975 — $263 ton
May 1980 — $298 ton
Up 13%

Medium Capacity Combine

June 1975 — $27,300
June 1980 — $47,500
Up 74%

NOTABLE NUMBERS

Peak hog numbers in Montana were reached in 1944, with 445,000 head.

On December 1, 1979 we had 209,000.

PASTURE AND RANGE CONDITION DETERIORATES

Montana pasture and range feed conditions declined 6 points in July, averaging 63 percent on August 1 compared with 69 one month ago. All areas of the State except the region west of the Divide showed reductions. Early July rains improved grazing conditions in the northwest and southwest, but compared with last year, conditions averaged 4 points lower.

CATTLE ON FEED DOWN

Cattle and calves on feed August 1 for slaughter market in the 7 States preparing monthly estimates totaled 6.89 million head--down 4 percent from a year ago and 12 percent less than August 1, 1978.

Marketing of fed cattle during July totaled 1.35 million--down 8 percent from last year and 16 percent from July 1978. This is the lowest number of July marketings from the 7 States since 1975. Placements of cattle and calves on feed in the 7 States during July were 1.52 million--a 25 percent increase from last year but 3 percent less than July 2 years ago.

Net placements of 1.44 million were 31 percent more than July last year but 3 percent below July 1978. Other disappearance during July totaled 79 thousand head compared with 108 thousand during July 1979 and 78 thousand during July 1978.

PLEASE RETURN

TRACTOR SHIPMENTS DOWN

Census data on U. S. tractor shipments show only 74,507 wheel-type tractors shipped January-May this year compared to 95,843 the same period a year earlier--a reduction of 22 percent.

AUGUST 1, ALL WHEAT CROP PROSPECTS DOWN

Yield prospects for the major Montana grain crops were reduced by the dry conditions during July.

The 1980 all wheat crop for Montana is expected to total 110.6 million bushels--5 percent less than a year ago and 5 percent below a month earlier. Lower yields are responsible for the reduced production since the acreage of wheat for harvest is about the same as last year. Winter wheat production at 55.0 million bushels is down 2.4 million bushels from last year and 2 million less than July 1 due to a one bushel reduction in yield. Spring wheat production at 51.0 million bushels is down 2 percent from 1979; and 7 percent below July 1 due to a reduction in acreage for harvest. Durum wheat production is estimated at 4.6 million bushels--2.3 million bushels below 1979 but 4 percent above the forecast a month ago.

The State's barley crop estimated at 42.1 million bushels is up 4 percent from 1979 and 5 percent above July 1. The 1980 oats crop at 4 million bushels is down 27 percent from last year--mostly due to a 21 percent decrease in the acres of oats for harvest. All hay production for Montana is down 2 percent from a year ago at 4.2 million tons. Production prospects of most principally irrigated crops are above a year ago. Dry bean production at 195,000 hundredweight is up 11 percent. Corn for grain at 450,000 bushels is up 17 percent, while sugarbeet production is up 2 percent at 848,000 tons.

Nationally, all wheat production is forecast at a record high 2.32 billion bushels (63.3 million metric tons)--virtually unchanged from the July 1 forecast but 9 percent more than last year. The 90 percent confidence interval for this production forecast is 2.25 to 2.40 billion bushels. The winter wheat crop is now forecast at 1.87 billion bushels--up 1 percent from the July 1 forecast. The durum wheat production forecast is up 11 percent, while other spring wheat is down 6 percent from a month earlier.

MOST PRICES HIGHER

Montana farmers and ranchers received mostly higher prices for their products during July than a month earlier. The index of prices received for all farm products at 266 (1967=100) was 10 points higher than a month ago and 8 points over mid-July a year ago. The prices received index for crops at 285 was 17 points over last month and 51 points above a year ago. Higher prices were received during July for all crops except winter wheat and oats. The livestock price index at 254 was 3 points above last month but 24 points below last year. All livestock items except sheep, milk, & eggs registered price increases during the month, while wool remained unchanged.

For the nation, the July index of prices received by farmers increased 12 points (5.2 percent) to 244 percent of its January-December 1967 average. Contributing most to the increase since June were higher prices for hogs, soybeans, corn, broilers, potatoes, and cattle. The index was unchanged from a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for July 15 was 280--up 2 points (.7 percent) from mid-June. The major contributors to the increase were higher prices for (1) feed, (2) family living items, and (3) feeder livestock. Compared to a year earlier, the index was up 28 points (11 percent).

July 1 Cattle Inventory

NOTABLE NUMBERS

The peak in Montana cattle numbers was reached January 1, 1974, with 3.4 million head--nearly 5 times as many cattle as people.

MONTANA CATTLE NUMBERS REDUCED BY DROUGHT

A mid-year survey of Montana cattlemen revealed 2 percent fewer cattle and calves on July 1, 1980 than a year earlier. The all cattle and calf inventory at 3.68 million head this year compares with 3.75 million a year ago. The drought in eastern Montana was mainly responsible for the decrease. Montana herds had been rebuilding after a decline which ended over a year ago. Cattle have been moved from drought-stricken areas to better ranges, and marketings for slaughter have increased. Grazing conditions in central and western Montana are excellent and herd rebuilding is likely continuing there. The July 1 beef cow inventory at 1.54 million head is down 1 percent, but milk cows at 28,000 head are up 4. Heifers for beef cow replacement are down 15 percent, forestalling herd rebuilding in many areas next year. Milk heifers are down 27 percent and other heifers are off 12. Steers weighing over 500 pounds are estimated at 230 thousand head--off 11 percent but calves on hand are up 2. The Montana 1980 calf crop is estimated at 1.54 million head--up 3 percent from 1979. The increase reflects the larger number of cows on hand before the drought liquidation.

Nationally, the July 1 cattle inventory was 123 million head--up 4 percent from a year earlier. Herd rebuilding is underway. Cows were up 5 percent, all heifers up 1 percent, and beef replacement heifers were up 2 percent. Steers were down 1 percent and calves on hand July 1 were up 6 percent. The 1980 calf crop is estimated at 45.5 million head--6 percent above last year.

SLAUGHTER OUTPUT UP

Montana slaughter plants produced 18 percent more red meat during June than the same month one year ago. Total production at 15.2 million pounds compares with 12.9 million pounds last June and 15.7 million pounds during May 1980. Production for January-June 1980 at 89.9 million pounds is 32 percent more than the same period one year ago.

Commercial red meat production for the United States in June 1980 totaled 3.09 billion pounds--up 3 percent from June 1979. January-June red meat production at 19.3 billion pounds was 6 percent above last year. The 1980 accumulated production changes by individual components were: beef, down 1 percent; veal, down 15 percent; pork, up 18 percent; lamb and mutton, up 10 percent.

CATTLE ON FEED

Montana feedlots held 2 percent more cattle and calves July 1 this year compared with a year ago. There were 49,000 on feed for the slaughter market, with the breakdown by class showing 29,000 steers--up 26 percent from last year, 19,000 heifers--down 21 percent, and 1,000 cows, the same as last year.

Weight breakouts show 21,000 steers and heifers weighing over 900 pounds.

There were 21,000 cattle and calves placed on feed from April 1 - June 30--40 percent more than the preceding year. In the same quarter, 19,000 were moved out of feedlots to be slaughtered--27 percent more than the same quarter last year.

Feeders expect to market 32,000 in the July - September quarter. This would be 7,000 more than last year for that quarter.

LAMB CROP And WOOL

Montana's 1980 lamb crop is estimated at 370,000 head--up 9 percent from 1979. Lambs saved per 100 ewes one year old and older on hand January 1 is 108--3 more than last year and 9 more than the U.S. average.

Wool production in Montana is placed at 4,458,000 pounds--up 4 percent from a year ago. The total number of sheep shorn at 456,000 head was up 3 percent from 1979.

MILK PRODUCTION UP

Montana milk production was 5 percent above last year in the second quarter (April-June) of 1980. About 1,000 cows have been added to the milking herd since last year and production per cow is also up. The 28,000 cows in the State produced 77 million pounds of milk in the period April-June. Dairymen fed 12 pounds of grain and concentrates per day to each milk cow. The price for grain fed averaged $6.10 per cwt.--20 cents more than in the previous quarter.

WORLD MEAT PRODUCTION & TRADE

Total meat production in the major importing countries is expected to increase 3 percent to a record level in 1980. Pork, poultry and lamb and mutton production is predicted to increase 4 percent--3 percent and 2 percent respectively. Beef and veal output may decline about 1 percent from the 1979 level.

With total meat production up in the major importing countries, net imports of all meats, led by pork, beef and poultry, are expected to fall. Global trade in beef and veal is expected to decline in 1980 as the substantial drop in shipments to the United States, Canada, Brazil, Korea, Israel and others will outweigh larger movement to countries such as the USSR and Japan. Beef and veal imports by the United States, the world's largest importer, are expected to drop substantially below last year's level. Lower U.S. import prices for beef are not attracting beef from many exporting countries--especially as many of these countries are rebuilding their beef cattle herds.

Poultry meat and lamb and mutton supplies are expected to be more plentiful on the world market and supported by demand from Middle Eastern countries and the Soviet Union, trade is increasing accordingly. Trade in pork, however, is expected to decline substantially on the world market in view of increased supplies in many countries. This is best illustrated by the major markets, as they move this year from a net import position for pork to a net export position.

LAND BROKEN UP FOR CROPPING

Our definition of "New Cropland" is land broken up for cropping which was previously native sod, improved pasture and the other land not tilled in the past 3 years. The Montana Crop and Livestock Reporting Service has been collecting data on new lands broken up for the past 6 years. New land broken up in Montana for cropping totaled 185,000 acres during the July 1, 1979 to June 30, 1980 period. Of this amount, 180,000 acres were actually cropped.

The second table shows the total of planted acreage estimates for 1975-80 and the change in acreage each year. The results from these two approaches do not agree exactly and probably shouldn't since summerfallow practices can change and some crop land may be withdrawn and put into permanent pasture, new hay seedings or other uses.

NOTABLE NUMBERS

The 1974 Census of Agriculture showed Chouteau County, Montana, the Number 1 county in the nation in acres in cropland.

WORLD WHEAT PRODUCTION UP

World 1980/81 wheat production is forecast at 444 million metric tons--6 percent higher than last year but 1 percent below the record 1978/79 crop. Worldwide crop conditions have been better than last season with the notable exception of continued dryness in the northcentral United States and Canada. Production is expected to be larger in the United States, USSR, Western Europe, Eastern Europe, and parts of the Mid-East and Asia. Smaller crops are likely in China, India, and Australia.

RAIN IMPROVES PASTURES AND RANGES

Montana pasture and range conditions improved dramatically in June as significant rain pushed deeper into the drought-stricken eastern counties.

The State average jumped 12 points from June 1 to July 1, averaging 69 percent for the entire State. Large portions of northcentral and central Montana received life-giving moisture and the ranges turned green for the first time this year. The eastern fourth of Montana remains in extreme drought with only showers bringing slight relief to some areas.

STATE	100	79	69

GRAIN CROPS MAKE RECOVERY

Montana 1980 production of durum wheat will be down considerably but output of hard spring wheat will be higher and winter wheat production will be essentially the same as last year based upon July 1 conditions. Late May and June precipitation significantly improved crop prospects in central and northcentral Montana, but crops in the eastern third remain poor.

The 1980 all wheat crop is expected to total 116.6 million bushels--essentially the same as the 1979 output of 116.5 million. Winter wheat production at 57.2 million bushels is down slightly from last year, but up 36 percent from the June 1 forecast. Durum production at 4.4 million bushels is down 36 percent from last year. This is mainly a result of reduced yields in dry northeastern Montana where most of the durum crop is grown. Production of hard spring wheat at 55.0 million bushels is up 5 percent from 1979. The increase is due to an 8 percent increase in acreage for harvest as yield dropped slightly. The large acreage of hard spring wheat in northcentral Montana has done well.

The State's expected barley crop at 40.0 million bushels is down 1 percent due to a smaller yield; acreage for harvest increased slightly. The 1980 oats crop is expected to produce 4.0 million bushels--down 27 percent. The large decrease is mainly due to a 21 percent decrease in harvested acres.

Sweet cherry production is forecast at 2,200 tons compared with 2,950 tons last year. Set was light and hail damaged some orchards in late June.

MOST PRICES REGISTER INCREASES

Higher prices for all products except winter wheat, sheep and wool pushed the June index of prices received by Montana farmers and ranchers to 254 percent of its 1967 average. This is 4 percent above the May index, but 1 percent below the June 1979 index. The index of all livestock and products increased 8 percent from May, while the all crops index advanced only 1 percent. However, compared with June a year ago, the crops index is up 19 percent, while the livestock index is down 11 percent.

Durum wheat showed a substantial price increase from the previous month, but winter wheat registered a decline. All other grain prices advanced moderately, but hay prices strengthened considerably.

Most livestock prices increased from May, but sheep and wool prices held steady.

The June index of prices received by U.S. farmers increased 1 percent to 230 percent of its January-December 1967 average. Contributing most to the increase since May were higher prices for hogs, apples, cattle, peaches, tomatoes, and cabbage. Lower prices for lettuce, wheat, grapefruit, hay, cotton, and milk were partially offsetting. The index was 6 percent below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for mid-June was 277--up 0.7 percent from May. The major contributors to the increase were: (1) the feeder livestock index, (2) the farm machinery indexes, and (3) family living items. Compared with June 1979, the index was up 11 percent.

1/ Ratio of Index of Prices Received by Farmers to Index of Prices Paid, Interest, Taxes, and Farm Wage Rates.

CONSUMER PRICE INDEX

The May CPI for all urban consumers, 1967 base, was 244.9. This was up 1.0 percent from April and up 14.4 percent from April 1979.

THE CPI HOTLINE

TELEPHONE: (816) 374-2372

Want quick information on the national Consumer Price Index (The CPI)? You can obtain that information 24 hours a day, 7 days a week from the CPI Hotline. CPI users calling the hotline number, (816) 374-2372 will hear a recorded statement, providing the latest available Consumer Price Index.

MANUFACTURED DAIRY OUTPUT INCREASES

Montana dairy plants manufactured 181,000 gallons of ice cream during May--12 percent more than May 1979 and 14 percent more than April 1980. Creamed cottage cheese output at 460,000 pounds was 1 percent more than last year. Butter production at 152,000 pounds was 3 percent greater than April 1979.

MINK PRODUCTION

Mink pelt production in the United States in 1979 totaled 3.39 million pelts--up 1 percent from 1978. Wisconsin, the major mink State, produced 978 thousand pelts--3 percent fewer than the 1.0 million pelts produced in 1978.

By color class, the number of pelts as a percent of the total U.S. production was: standard, 36.1 percent; ranch wild, 6.1 percent; demi-buff, 19.5 percent; pastel, 17.2 percent; pearl, 5.0 percent; violet, 5.2 percent; and the remaining color classes accounted for 10.9 percent.

Mink pelts sold during the 1979 crop year were valued at 140 million dollars. This is an increase of 6 percent compared with the value of 132 million dollars for pelts sold during the 1978 crop year. The average price per pelt for the 1979 crop year was $41.30 compared with $39.30 a year ago.

Mink females bred to produce kits in 1980 totaled 1.04 million--up 6 percent from the 978 thousand the previous year. Bred females and percent changes from a year ago for the two major color classes are: standard, 406 thousand females bred--up 9 percent; pastel, 171 thousand--up 3 percent. Females bred in the leading mink States and percent changes from 1979 are: Wisconsin, 282 thousand--up 6 percent; Utah, 149 thousand--up 6 percent; and Minnesota, 134 thousand--up 10 percent.

There were 1,097 mink ranches producing pelts in 1979--up fractionally from the 1,095 ranches a year ago. Wisconsin with 253 ranches was down 2 percent; Utah with 190 was virtually unchanged; and Minnesota with 150 was up 6 percent.

Economics, Statistics and Cooperatives Service-USDA and Montana Department of Agriculture • ISSUED TWICE MONTHLY

HIGHLIGHTS IN THIS ISSUE

Montana Grain Stocks Down
Slaughter Up
U. S. Hog Inventory Higher
Egg Production
Wheat Importing and Exporting Countries

HOG INVENTORY HIGHER

Inventory of hogs and pigs on June 1, 1980 in the U.S. was estimated at 65.9 million head, 1 percent above last year--19 percent larger than 1978 and the largest June inventory of record. Breeding Inventory at 9.53 million head was 8 percent less than a year ago but 7 percent above two years earlier. Market Hog Inventory at 56.4 million head was 3 percent larger than 1979 and 22 percent greater than 1978.

The December 1979-May 1980 U.S. pig crop was 53.0 million head--a 5 percent increase from last year and 25 percent more than two years ago. Sows farrowed during this 6-month period at 7.33 million were 2 percent more than those farrowed last year. Pigs saved per litter at 7.23 were well above the 1978 and 1979 levels of 7.04 and 7.05 respectively.

U.S. producers intend to have 6.72 million sows farrow during the June-November period--a decrease of 8 percent from the same period in 1979 but 5 percent above 1978.

NOTABLE NUMBERS

The Soviet Union was the largest importer of wheat during the 1979 marketing year, followed by China, 2nd and Japan 3rd.

SLAUGHTER PLANTS INCREASE OUTPUT

Montana slaughter plants produced 33 percent more red meat during May than the same month one year ago. Total production at 15.7 million pounds compares with 11.8 million pounds last May and 15.4 million pounds during April 1980. Production for January-May 1980 at 74.7 million pounds is 35 percent more than the same period a year ago.

Commercial red meat production for the United States during May 1980 totaled 3.31 billion pounds--up 6 percent from May 1979. January-May red meat production at 16.2 billion pounds was 7 percent more than last year. The 1980 accumulated production changes by individual components: beef, down 1 percent; veal, down 17 percent; pork, up 20 percent; lamb and mutton, up 12 percent.

Venezuela	100	33
		2,352

1/ In the 1978 crop year, China was 1st and USSR was 3rd.

TRACTOR SHIPMENTS DOWN

The Bureau of the Census reports wheel-type tractor shipments from factories totaled 48,826 during January-March 1980--down 13 percent from the same period in 1979 but up 2 percent from January-March 1978. March only shipments were down 26 percent from 1979 and off 16 percent from 1978.

Apparently, the tractor manufacturers anticipate reduced sales in 1980.

Total 1979 wheel-type tractor shipments were 16 percent higher than in 1978 so there may be sizeable numbers in dealers hands.

GRAIN STOCKS--JUNE 1, 1980

Stocks of wheat held in Montana on June 1, 1980 in all storage positions totaled 73.5 million bushels--down 16 percent from a year ago. The smaller stocks are due to a smaller carryover from the previous crop year and a smaller wheat crop in 1979. On farm storages accounted for 79 percent of the total wheat stocks, slightly less than last year at this time.

Winter wheat at 43.5 million bushels was down 12 percent from last year. All spring wheat at 30.0 million was down 21 percent and the durum portion at 4.6 million was down 36 percent. Disappearance of wheat from storage during the April-June quarter at 22.5 million bushels was 35 percent less than last year.

Barley stocks in all positions at 11.1 million bushels were 59 percent less than last year. Oats at 3.1 million bushels were down 50 percent.

MONTANA EGG PRODUCTION DROPS

Layers in Montana produced 41 million eggs in the period March 1 through May 31. This is down 13 percent from the same quarter in 1979. The average number of layers during the March-May period was 725,000--down 7 percent from the same quarter last year. Rate of lay dropped to 62 percent--down 4 percent from the same quarter in 1979.

Nationally, 17.4 billion eggs were produced during the March through May quarter. This is about the same as one year ago. The average number of layers on hand during the period totaled 283 million--1 percent less than a year earlier.

Rate of lay for the quarter averaged nearly 68 percent--up slightly from the same period in 1979.

NOTABLE NUMBERS

Montana is second in the nation for land in farms and ranches--62 million acres.

MONTANA WINTER WHEAT CROP DOWN SHARPLY

Prospects for Montana's 1980 winter wheat crop came into sharper focus with release of the June 1 crop forecast of 42.0 million bushels. This is 29 percent below the last forecast, issued May 1 and 27 percent below last year's winter damaged crop. A winter wheat crop of this size would be the smallest since 1970.

Both acreage for harvest and expected yield were reduced since May 1. Poor germination last fall and continued dry weather in many wheat areas this spring are blamed for the poor crop prospects.

Only 5 other winter producing States show a reduction from 1979--among them are the important Texas and Oklahoma areas.

The U. S. winter wheat crop is expected to be a record 1.76 billion bushels--9 percent greater than last year and a 3 percent increase over last month's forecast.

CHERRY PRODUCTION DOWN

This year, Montana's cherry crop is forecast at 2,200 tons--down 25 percent from last year's bumper crop. Some concern has been expressed by growers over the affects of volcanic ash fallout but generally production prospects are good.

In the six western States, production is forecast at 146,600 tons--down 4 percent from last year, but 27 percent greater than the 1978 production.

PASTURE AND RANGE CONDITIONS

Rains brought abundant moisture to western and southcentral Montana in May but continued to bypass the drought-stricken eastern areas.

Pasture and range conditions vary according to the rainfall pattern. They are good to excellent in the west and decline across in central areas reaching extreme drought in the eastern sections. Livestock are being moved out of the area to seek grazing or to be sold. Supplemental feeding is widespread.

The State average condition at 57 reflects the severe drought in eastern counties and is the lowest June 1 average on records dating back to 1923.

MANUFACTURED DAIRY OUTPUT INCREASES

Montana dairy plants manufactured 159,000 gallons of ice cream during April--11 percent more than April 1979 but 9 percent less than the previous month. Cream cottage cheese output at 440,000 pounds was 7 percent more than last year. Butter production at 172,000 pounds was 21 percent greater than April 1979.

PER CAPITA CONSUMPTION

Per capita consumption of red meats on a retail weight basis declined to 147.6 pounds in 1979--2.1 pounds below 1978 and the lowest leve since 1975. However, poultry consumption increased by 4.7 pounds--more than offsetting the decline in red meats. Thus, total consumption of red meats and poultry rose to a record-high 209.2 pounds--2.4 pounds more than in 1978.

AGRICULTURAL PRICES

The May 1980 index of prices received by Montana farmers and ranchers rose less than 1 percent from last month, reaching 251 percent of the 1967 base. The crops index remained unchanged from last month, while the livestock index rose 2 percent. However, compared with May a year ago, the crops index is up 27 percent but the livestock index is down 13 percent.

Barley and oats prices were down 9 and 11 cents per bushel respectively, while winter wheat declined 4 cents per bushel to $3.43. Spring and durum wheat prices rose 4 cents and 22 cents per bushel respectively. Cattle and sheep prices increased for all categories, while hogs, milk, eggs, and wool prices declined.

The May index of prices received by farmers nationally increased 1 percent to 226 percent of its January-December 1967 average. Contributing most to the increase since April were higher prices for oranges, hay, corn, broilers, and potatoes. Prices were also higher for cotton, soybeans, and hogs. Lower prices for eggs, milk, and cattle were partially offsetting. The index was 8 percent below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for mid-May was 275--up less than 1 percent from April. Higher prices for feed, fertilizer, family living and agricultural chemicals were partially offset by the lower prices for feeder livestock. The May index was 10 percent above a year earlier.

ALFALFA SEED PRODUCTION

Montana alfalfa seed production in 1979 totaled 5,880,000 pounds according to final figures tabulated after the bulk of the crop had been cleaned. The 1979 total is 166 percent more than the 1978 production and reflects a 62 percent increase in acreage and a 65 percent jump in yield. The farm value of production at $4,798,000 was 126 percent more than a year earlier. In 1979, the season average price per 100 pounds was $85 compared with $100 in 1978.

NOTABLE NUMBERS

Montana has 4.5 million acres in strip-cropping--more than any other State in the nation.

FARM LABOR UP

The total number of workers on Montana farms and ranches during the week of April 6-12, 1980 was estimated at 35,000--3 percent above April 1979. Farm operators plus unpaid family members working 15 hours or more per week were up 9 percent from last year but hired workers at 10,000 were down 9 percent from April 1979.

LIVESTOCK SLAUGHTER UP SHARPLY

Montana slaughter plants produced 49 percent more red meat during April than the same month one year ago. Total production at 15.4 million pounds compares with 10.3 million pounds last April and 13.2 million pounds during March 1980. Production for the first four months of 1980 at 59.0 million pounds is 36 percent more than for the same period a year ago.

Commercial red meat production for the United States during April 1980 totaled 3.31 billion pounds--up 15 percent from April 1979. January-April red meat production at 12.9 billion pounds was 7 percent more than last year. The 1980 accumulated production changes by individual components: beef, down 2 percent; veal, down 18 percent; pork, up 22 percent; lamb and mutton, up 11 percent.

MONTANA AGRICULTURAL LAND VALUES UP

Montana land values increased an average of 17 percent during the 12 months ended February 1, 1980 according to the Montana Crop & Livestock Reporting Service. Irrigated farm land with improvements was valued at $1,035 per acre this February compared with $875 a year earlier. Dry farm land with improvements was valued at $340 per acre--up from $305 February 1, 1979. Non-irrigated grazing land was valued at $180 per acre compared with $150 a year earlier.

Land value data are based upon reports from about 300 farmers and ranchers who reported values of agricultural land in their localities.

These values exclude land where value is affected by use or offer for non-agricultural purposes.

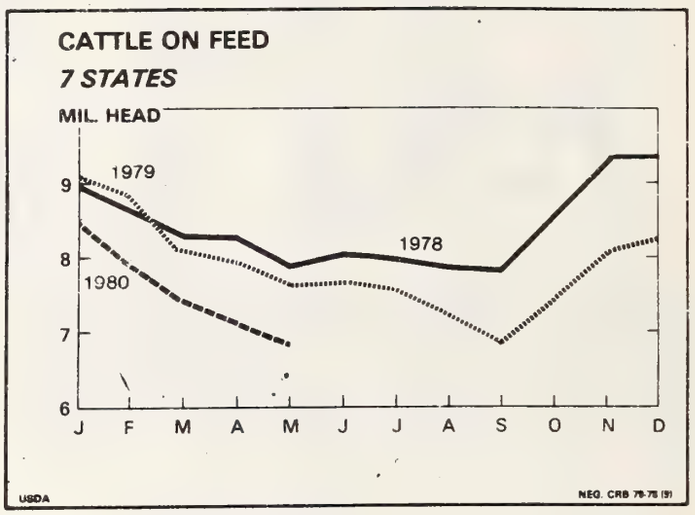
MONTANA LAND VALUES--FEB. 1, 1979 & 1980 1/

	Feb. 1, 1979	Feb. 1, 1980
	Dollars per Acre	
Irrigated farm land	$875	$1,035
Dry farm land	305	340
Non-irrigated grazing land	150	180

1/ Including improvements.

CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed May 1 for slaughter market in the 7 States preparing monthly estimates totaled 6.83 million head, down 11 percent from a year ago and 13 percent less than May 1, 1978. This is the lowest May 1 number on feed since 1975. Marketings of fed cattle during April totaled 1.45 million--down 6 percent from last year and 15 percent from April 1978. Placements of cattle and calves on feed in the 7 States during April were 1.25 million--down 15 percent from last year and off 19 percent from April 2 years ago. This is the lowest April placements in the 7 States since 1973. Net placements of 1.12 million were down 11 percent from a year ago and were 14 percent below 2 years ago. Other disappearance totaled 130 thousand head compared with 220 thousand during April 1979 and 235 thousand during 1978.



MILK: Production, Disposition, Cash Receipts and Gross Income, 1978-1979

		MONTANA		UNITED STATES

Gross farm income from dairy products 6/	(000) Dol.	31,441	33,032	12,815,653	14,795,067

1/ Average number during year excluding heifers not yet fresh.
2/ Excludes milk sucked by calves.
3/ Percentage of milk sold to plants and dealers that is eligible for fluid use (Grade A in most States). Includes fluid grade milk used in manufactured dairy products.
4/ Price of milk sold to plants and dealers.
5/ Valued at average returns per 100 pounds of milk in combined marketings of milk and cream. Includes value of milk fed to calves.
6/ Cash receipts from marketings of milk and cream plus value of milk used for home comsumption and producer-churned butter.

WORLD CROP PROSPECTS

World 1979/80 (July-June) wheat and coarse grain production is estimated at 1.15 billion metric tons--down 4 percent from last year. The decline is due primarily to a 25 percent decline in production by the Soviet Union and a 21 percent decline in Argentine production. Smaller crops also occurred in Europe, Canada, and Australia, while the U. S. crops of wheat and coarse grains were record large.

The world wheat and coarse grain supply for 1979/80 is estimated at 1.35 billion tons--down 1 percent from last year. Utilization is expected to exceed production by 22 million tons, which would reduce ending stocks to 178 million tons.

COARSE GRAIN CROP TO DECLINE

World 1979/80 coarse grain production now estimated at 732 million tons is down about 2 percent from last year's record crop. Most of the decline in the crop is attributable to smaller crops in the Soviet Union and Argentina, where coarse grain production is expected to fall nearly 30 percent from last year. Smaller coarse grain crops were also experienced in Canada, Australia, and Western Europe. In the United States, however, coarse grain production rose nearly 8 percent.

World 1979/80 coarse grain use is expected to decline to 737 million tons--slightly below 1978/79. Utilization in the USSR is expected to drop about a tenth because of reduced supplies. Use will be up only 1 percent in the rest of the world. A stocks decline of 5 percent to around 90 million tons is projected this season. The United States carries nearly 60 percent of world stocks of coarse grain.

SOUTHERN HEMISPHERE GRAIN PRODUCTION PROSPECTS

Southern Hemisphere (Brazil, Argentina, South Africa, and Australia) 1980 coarse grain production is forecast at 50 million tons--virtually unchanged from last year. Most of these crops are being harvested now. South African and Brazilian production is expected to increase 24 and 18 percent respectively. The Australian crop is 7 percent below last year. The Argentine coarse grain crop is estimated at 12 million tons--nearly 30 percent below last year's reduced crop because of dry weather during the growing season--especially during critical periods prior to harvest.

ON THE SPOT WHEAT COUNT

What is the best way to get a handle on how this season's wheat crop is shaping up? Go out to some fields and check it.

That's just what enumerators from the Montana Crop and Livestock Reporting Service do to judge potential yield. A sample of fields scattered across Montana will be visited each month during the growing season to follow development and determine through specific measurements and counts how the crop is likely to turn out at harvest.

With the farmers' approval, enumerators walk a given number of rows and paces into the randomly selected fields and lay at sample units. The units may turn up in good spots or bad ones, but overall, they balance out to provide unbiased information for wheat yield in Montana.

The enumerator counts the number of plants and measures the distance between rows in the unit to indicate plant population per acre. Next, he observes the stage of development, then counts and measures such plant characteristics as number of emerged heads, mature heads, and spikelets for a gauge to yield per plant.

When the crop is mature, the enumerator hand harvests the sample unit for laboratory analysis. After the farmer harvests the field, the enumerator makes a final visit to glean a small section to determine harvest loss and arrive at an estimate of net yield per acre.

The information from these objective yield counts and measurements, plus other facts supplied from surveys of producers, furnish reliable and timely production estimates to help remove speculation about farm, production, and strengthen the farmers' marketing position.

POTATO STOCKS HIGHER

Montana producers had 260,000 cwt. in storage May 1, 1980--30 percent above a year ago.

Nationally, there were 63.5 million cwt. in storage May 1, 1980. This was 2 percent below the stocks on hand May 1, 1979--the first year the May 1 stocks estimates were available.

Hay Stocks

NOTABLE NUMBERS

Montana's largest wheat crop was in 1976 with 167 million bushels.

MORE WINTER WHEAT

MONTANA STATE LIBRARY
930 East Lyndale Avenue
Helena, Montana 59601

Montana's 1980 winter wheat crop is forecast at 59.4 million bushels as of May 1--4 percent above last year's small crop but 18 percent below last fall's forecast. This will make 2 consecutive crop years in which winter wheat growers found a sizeable portion of their fall-seeded crop with a poor stand as it came out of dormancy. As of May 1, it appeared that on the average across the State, 15 percent of the seeded acres would not be harvested. Most of the problem involved dry soils last fall that caused poor germination. The Northern Triangle has some of the best stands.

Yield per acre is expected to be 27 bushels based upon producer reports of condition May 1, 1.5 bushels above last year but 3 bushels below the 5-year average. Warm weather has hastened growth but moisture in April was below normal in most areas and dry soils pose a threat to yields.

PASTURE AND RANGE CONDITIONS POOR

Condition of Montana pastures and ranges May 1 continued to decline from April under seasonably warm temperatures and limited moisture. Conditions varied from extremely poor in the northeast and southeast to good to excellent in the west and southwest.

The May 1 condition averaged 68 percent of normal--5 points below April and the lowest May 1 condition figure since 1961.

MEAT ANIMAL RECEIPTS RECORD HIGH

Higher prices for cattle, sheep and lambs during 1979 brought Montana's meat animal cash receipts to a record high 738.9 million dollars--17 percent a above the previous year. Cattle and calves contributed 94.7 percent of the total cash receipts during 1979, while hogs represented 3.8 percent and sheep and lambs 1.5 percent of the total.

APRIL PRICES DOWN

The April 1980 index of prices received by Montana farmers and ranchers dropped 7 percent from last month. The crops index and livestock index shared equally in the month-to-month decline and dropped the all products index to 250 percent of its 1967 average. However, compared with April a year ago, the crops index is 18 percent higher, while the livestock index is down 20 percent.

Cow prices and hog prices lead the decline, with each off more than $6.00 per hundredweight compared with March. Every item in the index computation joined the downward slide except for hay and milk. The April milk price remained unchanged from March, while hay prices strengthened.

The U.S. index of prices received by farmers decreased 5 percent to 223 percent of its January-December 1967 average. Contributing most to the decrease since March were lower prices for cattle, hogs, soybeans, wheat, corn, and calves. Higher prices for lettuce, hay, cucumbers, apples, tomatoes, and onions were partially offsetting. The index was 9 percent below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for mid-April was 274--unchanged from March. Higher prices for fuels and energy, farm and motor supplies, seed and family living items were offset by lower feed and feeder livestock prices. The April index was 11 percent above a year earlier.

1/ Ratio of Index of Prices Received by Farmers to Index of Prices Paid, Interest, Taxes, & Farm Wage Rates.

MORE ACRES IN FEED GRAINS NATIONALLY

Farmers surveyed around April 1 indicated they'd plant about 2 percent more feed grain acreage this year than last. Prospects for 82 million acres of corn--2 million more than last year--account for most of the increase. Only oat plantings were indicated smaller.

Corn production has set records every year since 1975. While it's too early to speculate on this year's crop, early-season conditions seem mostly favorable. However, tight credit and higher production costs may cause farmers to cut back on use of fertilizer, chemicals, and fuel, which could lower yields even if weather conditions are ideal.

ICE CREAM UP--COTTAGE CHEESE DOWN

Montana dairy plants manufactured 175,000 gallons of ice cream during March--5 percent more than March 1979. Cream cottage cheese output at 410,000 pounds was 2 percent less than last year. Butter production at 158,000 pounds was the same as last year.

HAY STOCKS

Hay stocks on Montana farms and ranches are 4 percent above last year at 901,000 tons. Hay supplies held up well because the winter was mild and livestock feed requirements were light.

Helena, Montana 59601

APRIL PROSPECTIVE PLANTINGS

Montana farmers intend to plant more spring wheat, barley and dry beans--but fewer acres of oats compared with a year ago. Acreage intended for durum shows a substantial increase of 16 percent, while other spring wheat acreage is expected to be up 4 percent. Last fall, growers seeded 2.6 million acres to winter wheat. Combining this acreage with the April intentions for durum and other spring shows total 1980 wheat seedings may be 5.7 million acres--4 percent less than 1979. Barley seedings are expected to be 1.2 million acres--up 9 percent from last year. Dry edible beans are expected to show the largest percentage increase, with 15,000 acres expected to be planted compared with 10,000 planted in 1979. The acreage seeded to oats is expected to be down 11 percent compared with last year. Total acres of hay for harvest are expected to decline 2 percent.

LIVESTOCK SLAUGHTER UP

Montana slaughter plants produced 19 percent more red meat during March than the same month one year ago. Total production at 13.2 million pounds compares with 11.1 million pounds last March and 14.4 million pounds during February 1980. Production for the first three months of 1980 at 43.6 million pounds is 32 percent more than for the same period a year ago.

Commercial red meat production for the United States during March 1980 totaled 3.10 billion pounds--an increase of less than 1 percent from March 1979. January-March red meat production at 9.54 billion pounds was 5 percent above last year. Changes by individual components: beef, down 5 percent; veal, down 20 percent; pork, up 21 percent; lamb and mutton, up 14 percent.

CATTLE ON FEED DOWN

Montana's cattle feedlots held 16 percent fewer cattle on April 1, 1980 being fattened for the slaughter market than a year ago. The total number on feed at 49,000 head was made up of 23,000 steers, 25,000 heifers, and 1,000 cows. Compared with last year, steers were down 5,000 head and heifers down 4,000. There were the same number of cows on feed as last year. Of the total steers and heifers, 13,000 weighed over 900 pounds, 17,000 weighed between 700-800 pounds, with the balance below 700 pounds.

During the January-April quarter, 18,000 finished cattle were marketed for slaughter--down 14 percent from last year. Cattle placed in feedlots during the quarter totaled 17,000--up 21 percent from last year. Montana feeders expect to market 20,000 head during the next 3 months--up 33 percent from last year.

MONTANA GRAIN STOCKS DOWN

Stocks of wheat stored in Montana on April 1, 1980 in all storage positions totaled 95.9 million bushels--down 21 percent from a year ago. The smaller stocks are a result of a 11 percent smaller carryin from the previous crop year--a 20 percent smaller 1979 wheat crop, and nearly 13 percent more moved out of storage during the October-April period compared with the same period a year ago.

Winter wheat at 51.7 million and all spring wheat at 44.2 million were both down 21 percent from last year. Durum at 6.4 million was down 23 percent. About 84 percent of all wheat was stored on farms with the remainder in mills and elevators. Disappearance of wheat from storage during the January-April quarter at 34.1 million bushels was 4 percent less than last year.

Barley stocks in all positions at 18.0 million bushels were down 47 percent and oats at 4.5 million was off 41 percent.

Nationally, all wheat stored in all positions on April 1, 1980 amounted to 1.23 billion bushels--down slightly from stocks on hand a year earlier and 20 percent less than two years ago. Farm stocks of 570 million bushels are 9 percent less than last year's 630 million bushels. On-farm storage this April 1 accounted for 47 percent of the total wheat stocks compared with 51 percent a year earlier. Off-farm wheat stocks at the beginning of April totaled 655 million bushels--10 percent more than last year's 596 million bushels. Indicated disappearance during the January-March quarter is 491 million bushels compared with 407 million bushels for the comparable period a year ago.

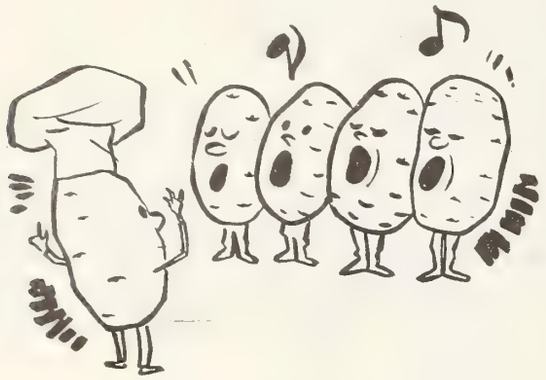
POTATO STOCKS SAME AS YEAR AGO

Montana producers had 1.10 million cwt. in storage April 1, 1980--the same as a year ago.

Nationally, there were 96.8 million cwt. of potatoes in storage April 1, 1980. This was 3 percent less than the record holdings last year, but 9 percent above stocks held on April 1, 1978.



FERTILIZER USE COULD FALL

U. S. fertilizer use may decline by 3 to 7 percent during the fertilizer year ending this June 30. According to a supplement to the Fertilizer Situation to be issued by the U.S. Department of Agriculture, greater-than-expected increases in prices farmers pay for fertilizer, energy, and interest relative to crop prices, combined with tight farm credit, will discourage fertilizer use this spring. Most forecasts made in late 1979, including USDA's, had called for a moderate increase in use this fertilizer year.

Net domestic supplies of fertilizers are expected to be about 14 percent higher this year. So, if the usual strong spring demand for fertilizer falls to materialize, prices could level off and possibly begin to decline--especially phosphates, before the planting season is finished.

MILK PRODUCTION INCREASES

Montana milk production in the first quarter (January-March) totaled 71 million pounds. This was 8 percent above the same quarter last year but 3 percent below the previous quarter. Average amount of grain fed to all cows in the herd on April 1 was 12.5 pounds per day--the same as last April 1.

NOTABLE NUMBERS

Montana's largest barley crop was in 1969 when 67,914,000 bushels were produced.

TOTAL VALUE OF MONTANA WOOL UP

Shorn wool production in Montana during 1979 totaled 4.3 million pounds--2 percent below the previous year. Average weight per fleece at 9.8 pounds was slightly below 1978. The average price rose 13 cents in 1979 to 94 cents per pound. As a result, the total value of the State's wool rose 14 percent to 4.0 million dollars.

The U.S. shorn wool production in 1979 was 103 million pounds--up 1 percent from 1978. Total value of the shorn wool was 88.7 million dollars, up 17 percent from 1978. The average price per pound nationwide was 86.3 cents in 1979 compared with 74.5 the previous year.

PASTURE AND RANGE FEED CONDITION

Montana pastures and ranges showed considerable variation as of April 1, 1980. Conditions were reported very poor in the northeast, but good to excellent in the west. Dry weather last fall caused grazing conditions to deteriorate, but the mild winter and some moisture this spring have improved conditions. New growth is beginning where moisture is available.

The State's condition averaged 73 percent of normal--14 points below last April's unusually good condition, but only 5 points below April 1978.

CASH RECEIPTS
1979 Preliminary

Marketings of crops and livestock in Calendar Year 1979 brought Montana farmers and ranchers 1,334.4 million dollars--down 3 percent from 1978 according to preliminary USDA estimates. Livestock and livestock product receipts were up 10 percent but crop receipts dropped slightly. Government payments totaled 33.0 million dollars and were less than one-fourth of the 1978 payments.

NET FARM INCOME: 1979 IN REVIEW

Last year, net farm income reached $33 billion--a jump of 18 percent from 1978. The increase in farm production expenses of $15.6 billion was more than offset by an increase of $17.9 billion in total cash receipts. Farm income was also enhanced by 1979's large grain crops which added to the value of inventories.

At $61.7 billion, cash receipts from crop marketings were up 18 percent from 1978. Cash receipts for wheat soared 45 percent, while corn receipts were up more than 35 percent. The record production of many grain crops normally would have caused prices to drop; instead, prices rose due to exceptionally strong domestic and foreign demand. Wheat prices jumped nearly 25 percent, while corn prices rose 12 percent. Soybean prices were up about 10 percent for the year.

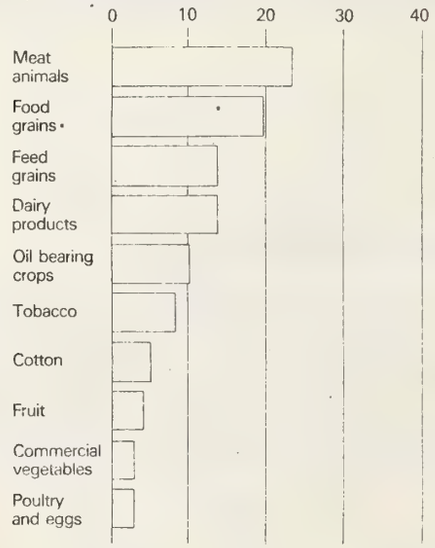
NET FARM INCOME TO DECLINE IN 1980

Current prospects indicate that net farm income will fall to the mid-$20 billion level in 1980. The reduction will be largely due to rapidly rising production expenses. Cash receipts for crops and livestock are forecast to increase about 5 percent. Prices will be higher for most crops, but total production will probably be somewhat lower as yields are unlikely to match the record highs of 1979.

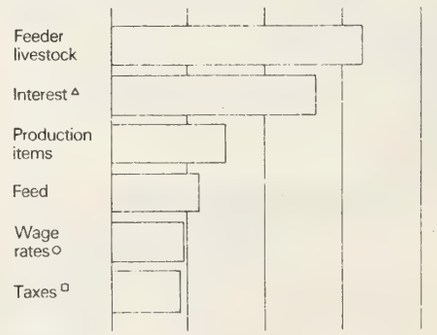
Larger production expenses--estimated to be up 13 percent this year--will more than offset the gain in cash receipts. Fuel and fertilizer prices will increase the most. With the amount of farm loans expected to increase and interest rates higher, interest charges are forecast to show a substantial increase over 1979.

Prices Received by Farmers Increased in 1979

Percent increase in indexes of prices received and paid by farmers (1978 to 1979)



. . . While Prices Paid Also Advanced



△ Interest payable per acre on farm. □ Farm real estate taxes payable per acre. ○ Seasonally adjusted.

CATTLE, GRAIN PRICES DROP

Lower prices for cattle, hogs, and small grains dropped the March index of Prices Received by Montana farmers and ranchers below the February index. The March Montana index of farm prices received at 270 (1967=100) was down 6 points from the previous month but up 4 points from 1979. The index of all livestock and products declined 2 points from the February index to 287, while the all crops index at 250 was 10 points below the February level.

Between February and mid-March prices for sheep, lambs, wool, and eggs showed increases, but cattle, hog, and milk prices fell somewhat. The all wheat price declined 16 cents per bushel due to the 31-cent drop in the price of winter wheat. Slight increases in the price of spring and durum wheat were partially offsetting. Barley was down 6 cents per bushel, while oats was down 2 cents.

The United States March index of Prices Received by farmers decreased 4 points (1.7 percent) to 234 percent of its January-December 1967 average. Contributing most to the decrease since February were lower prices for cattle, hogs, soybeans, wheat, corn, and calves. Higher prices for eggs, apples, tomatoes, and rice were partially offsetting. The index was 12 points (5 percent) below a year ago.

The mid-March index of Prices Paid by farmers for commodities, services, interest, taxes and farm wage rates was 274--up 3 points (1.1 percent) from February. Higher prices for fertilizers, fuels, farm equipment and agricultural chemicals, were only partially offset by lower prices for feeder livestock and feeds. Compared with a year earlier, the index was up 30 points (12 percent).

NOTABLE NUMBERS

National hog slaughter for January and February 1980 was the largest on record for these months.

FEBRUARY SLAUGHTER UP

Montana slaughter plants produced 46 percent more red meat during February than the same month one year ago. Total production at 14.4 million pounds compares with 9.8 million pounds last February and 16.0 million pounds during January 1980. Production for the first two months of 1980 at 30.4 million pounds is 38 percent more than for the same period a year ago.

Commercial red meat production for the United States during February 1980 totaled 3.05 billion pounds--up 11 percent from February 1979. January-February red meat production at 6.44 billion pounds was 7 percent above last year. Changes by individual components: beef, down 5 percent; veal, down 20 percent; pork, up 28 percent; lamb and mutton, up 16 percent.

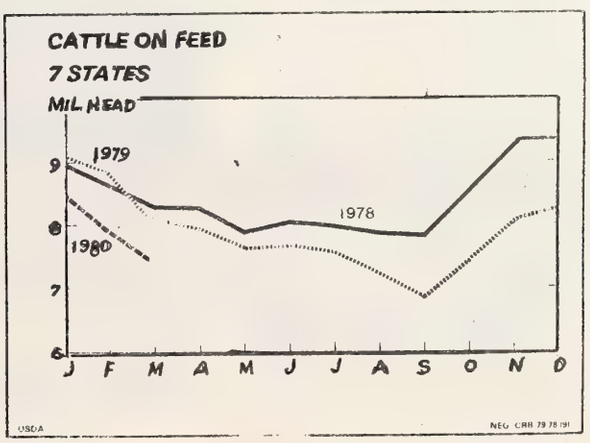
CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed March 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.44 million head, down 9 percent from a year ago and 10 percent less than March 1, 1978. Marketings of fed cattle during February totaled 1.57 million, down 5 percent from last year and 7 percent less than February 1978.

Placements of cattle and calves on feed in the 7 States during February were 1.21 million, down 8 percent from last year and off 21 percent from February 1978. Net placements of 1.05 million head were down 7 percent from a year ago and 21 percent below 2 years ago.

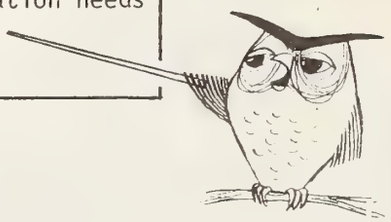


REMINDER

We have mailed out our 1980 subscription renewal forms to most of our readers.

If you received one, it must be returned by April 10 so we can keep your name on our mailing list and serve your information needs in 1980.

Do we have yours back yet?



MARCH 1 HOG INVENTORY

Inventory of hogs and pigs on March 1, 1980 in the 14 States conducting quarterly hog surveys was estimated at 54.7 million head--up 7 percent from a year earlier. This is the largest March 1 inventory since records began in 1970.

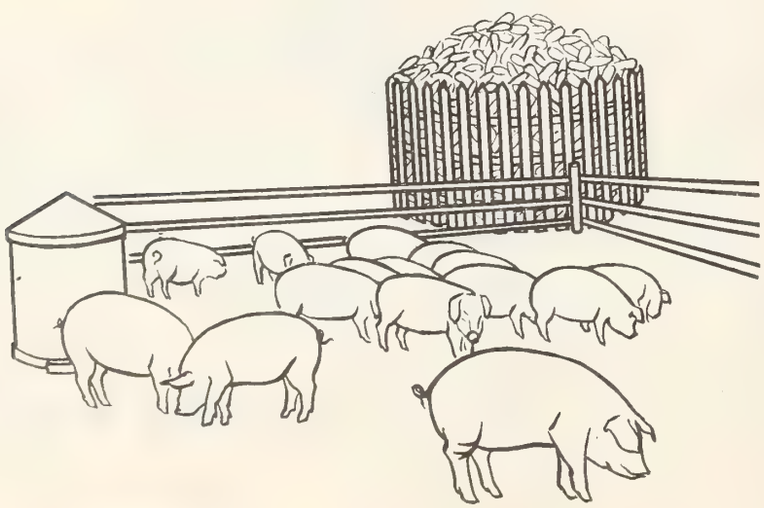
The number kept for breeding at 8.09 million was down 3 percent from 1979 but 17 percent above 1978, and number for market at 46.6 million was 9 percent above 1979 and 24 percent more than 1978.

The 14 quarterly States account for about 85 percent of the U.S. hog and pig inventory.

The December 1979-February 1980 pig crop in the 14 States totaled 19.6 million--7 percent more than 1979 and 26 percent more than 1978. There were 2.74 million sows farrowed in these States, up 3 percent from the previous year and 20 percent more than two years ago. Litter size averaged 7.17 pigs for the December 1979-February 1980 period compared with 6.87 a year earlier and 6.84 two years ago.

Producers in the 14 quarterly States intend to have 3.47 million sows farrow in the March-May 1980 period--about the same as last year.

Farrowing intentions reported for the June-August 1980 period are 3.07 million sows--3 percent below 1979.



POTATO STOCKS DOWN

Montana producers had 1.5 million cwt. of potatoes in storage March 1, 1980--14 percent below last year. Disappearance since harvest amounted to 300,000 cwt.

Nationally, there were 127 million cwt. of potatoes for all uses held on March 1, 1980 by growers, dealers and processors. This was 5 percent less than the record holdings last year but 5 percent above stocks on March 1, 1978.

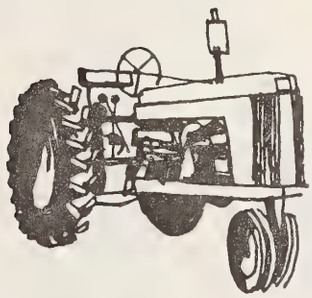
TRACTOR SHIPMENTS

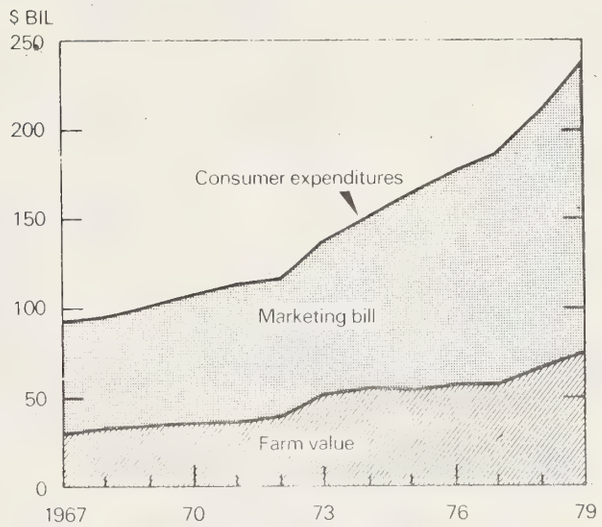
Farmers, ranchers and others closely connected with agriculture, frequently question the availability of statistics on commodities they buy, as well as on items they sell. The answer is--there are comprehensive statistics on the industrial production in the United States published periodically by the Bureau of the Census, Department of Commerce. These are in a series called"Current Industrial Reports". We recently got on their mailing list and received the first issue on tractor production and shipments. Tractors are a big item in farm production costs and some data on these are as follows:

Wheel-type tractors shipped by manufacturers for the last 6 months of 1979 were up 12 percent over the same period of 1978, and during December 1979 tractor shipments were up 10 percent from the same month in 1978, but about the same as December 1977. It looks as though tractor manufacturers have anticipated increased sales in early 1980. Just what this means to producers and other, I'm not sure. Perhaps that there will be an adequate supply of new tractors for the coming crop season and maybe some buys.

The chart below shows monthly cyclical patterns in wheel-type tractor shipments.



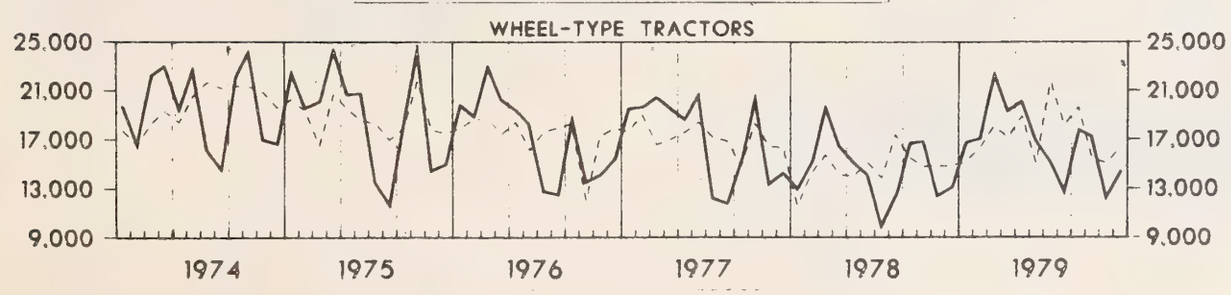
Marketing Bill, Farm Value, and Expenditures for Farm Foods



For domestic farm foods purchased by civilian consumers for consumption both at home and away from home. 1979 preliminary

Expenditures for farm foods based on the USDA figure were about 12 percent higher in 1979. The increase in spending was largely a result of higher food prices, as the volume of food purchases remained virtually unchanged. Spending for food in grocery stores for use at home rose nearly twice the rate of away-from-home food expenditures. This was largely attributed to a slump in away-from-home expenditures in the second quarter of the year when shortages and higher prices for gasoline limited travel to eating places.

SHIPMENTS OF TRACTORS
(Units Shipped)



FOREIGN OWNERSHIP OF U.S. AGRICULTURAL LAND

The Agricultural Foreign Investment Disclosure Act of 1978 required that all foreign owners of U.S. agricultural land report these holdings to the U.S. Department of Agriculture. This program was organized as an interagency effort--the Agricultural Stabilization and Conservation Service (ASCS) was responsible for collecting data and enforcing the Act, the Economics, Statistics, and Cooperatives Service (ESCS) was responsible for analyzing the data and publishing the periodic reports.

Foreigners owned 5.2 million acres of U.S. agricultural land as of October 31, 1979. This is less than 0.5 percent of all privately-held agricultural land and less than 0.25 percent of all land in the U.S. This share is unlikely to have an impact on agriculture--positive or negative. However, some communities could be locally affected in areas of heaviest concentration.

A substantial percentage of the land held or acquired by foreigners is used for forest or timber. Forest lands account for 43 percent of the reported acreage; crop, pasture, and other agricultural land for 53 percent; and nonagricultural land or no response for 4 percent.

U.S. corporations with foreign interests reported owning 76 percent of all reported U.S. foreign-held agricultural land. The remaining 24 percent was reported as being owned by foreigners not affiliated with U.S. corporations. U.S. corporations with foreign interests from the United Kingdom, the Federal Republic of Germany, and Luxembourg reported owning 52 percent of all reported U.S. foreign-held agricultural land.

Foreign holdings are concentrated in the South. Tennessee, Georgia, and South Carolina contain 25 percent of foreign-held U.S. agricultural land.

In Montana 261,736 acres were reported under foreign ownership--0.5 percent of the private land owned in the State.

Despite some reporting and perhaps enforcement problems, this procedure should measure the influence of foreign ownership over time.

EGG PRODUCTION DOWN

Montana's laying flocks produced 35 million eggs during the December 1, 1979 through February 29, 1980 quarter--down 24 percent from the same period a year ago. The average number of layers on hand during the quarter at 655,000 was down 19 percent and the average rate of lay at 59.5 eggs per 100 birds compares with 66.3 a year ago. Flocks have not fully built up since the PCB problems.

The Nation's laying flocks produced 17,685 million eggs during the same quarter--up 3 percent from last year. The number of layers averaged 293.2 million--up less than 1 percent from a year ago. The rate of lay on March 1 was 66.5 eggs per 100 layer compared with 65.0 a year earlier.

Agricultural Prices
Manufactured Dairy Products
Annual Crop Summary--1979
World Wheat Production

NOTABLE NUMBERS

The trend towards winter wheat in Montana has meant an added $325 million over the last 30 years.

PLEASE RETURN

ICE CREAM PRODUCTION UP, BUTTER DOWN

Montana dairy plants manufactured 124,000 gallons of ice cream during January--12 percent more than January 1979. Cream cottage cheese output at 418,000 pounds was up 9 percent from a year ago. Butter production at 215,000 pounds was down 10 percent from last year.

PROSPECTS OF RECORD WHEAT EXPORTS

Wheat: With the 1979/80 wheat marketing year more than half over, the prospect of a record export year is overshadowing this year's near-record supply. During June-December, overseas shipments totaled nearly 900 million bushels--up more than a tenth from a year earlier. In early January, U.S. wheat sales to the Soviet Union were suspended and the estimate of total 1979/80 wheat exports was lowered from 1,400 million bushels to 1,325 million. At this level, however, total exports will still exceed the previous record set in 1973/74 by more than 100 million bushels. Increased demand from other countries, including Egypt, Brazil, China, and Mexico, as well as some expanded shipments under food-aid programs are expected to offset some of the loss to the Soviet Union.

HIGHER PRICES FOR CATTLE BUT CROPS LOWER

Higher prices for cattle, hogs, and wool pushed the February index of prices received by Montana farmers and ranchers above a month earlier. The February Montana index of farm prices received at 275 (1967=100) was up 10 points from the January index and 23 points (9 percent) above a year ago. The index of all livestock and products was up 16 points from the previous month at 292, but the all crops index at 254 was 3 points below the January level.

Between mid-January and mid-February, prices for cattle, hogs and wool showed increases but sheep, milk and egg prices declined and lamb prices remained the same. Price drops were noted for all crop items. All wheat declined 2 cents per bushel, barley was down 8 cents, and oats was down 10 cents per bushel. Baled hay was down 2 dollars per ton.

The United States February index of prices received by farmers increased 2 points (.8 percent) to 238 percent of its January-December 1967 average. Contributing most to the increase since January were higher prices for cattle, calves, hogs, rice, oranges, and cotton. Lower prices for eggs, corn, soybeans, and broilers were partially offsetting. The index was 3 points (1.2 percent) below a year ago.

The U. S. index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for mid-February was 271--up 2 points (.7 percent) from mid-January. Higher prices for feeder livestock, fuels and energy, farm supplies and building and fencing materials more than offset the lower feed prices. The February index was 32 points (13 percent) above a year earlier.

NOTABLE NUMBERS

The current Montana cattle inventory is nearly three-quarters of a million head below the record high 6 years ago.

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 31 percent more red meat during January this year than the same month one year ago. Total production at 16.0 million pounds compares with 12.2 million pounds last January and 13.6 million pounds during December 1979. The January 1980 cattlekill was 14,900 head compared with 14,200 head in January 1979. The hogkill at 44,400 was up from 25,900 head January last year.

Nationally, commercial red meat production in January 1980 totaled 3.39 billion pounds--up 3 percent from January 1979. Beef production at 1.88 billion pounds was down 9 percent from January 1979, while pork production at 1.45 billion pounds was up 26 percent.

1/ Number of feedlots with 1,000 head or more capacity is number of lots operating anytime during year. Number under 1,000 head capacity and total number of feedlots is number at end of year. * Lots and marketings from larger size groups in Montana are included to avoid disclosing individual operations.

FARM LABOR

The total number of workers on Montana farms and ranches during the week of January 6-12, 1980 was estimated at 25,000--17 percent less than January 1979. Farm operators plus unpaid family members working 15 hours or more per week were down 31 percent from last year, but hired workers were up 30 percent from January 1979.

WHEAT UTILIZATION

Montana wheat shipped to out-of State destinations during the 1978 wheat marketing year (June 1978-May 1979) is estimated at 140.2 million bushels--including unaccounted disappearance. This represents 89 percent of the available supply. Use in the State for feed, seed and flour amounted to 16.7 million bushels.

In the 1978 marketing year, 105.8 million bushels of Montana wheat were shipped to the Pacific Northwest--including an allowance for unaccounted disappearance. Pacific Northwest flour mills used 21.5 million bushels and 84.3 million were exported from Pacific Northwest ports. By comparison, in 1977 flour mills used 19.9 million bushels and 70.7 million were exported.

Montana wheat accounted for 48 percent of the Pacific Northwest exports in 1978--a decrease of 9 percentage points from 1977.

Funds for Wheat Utilization and Movement to the Pacific Northwest were furnished by the Montana Wheat Commission.

CATTLE INVENTORY UP

Montana's cattlemen had 2.64 million head of cattle and calves in their herds at the start of 1980--1 percent more than a year ago. This continues the uptrend which started last July but still 735 thousand or 22 percent less than the peek inventory reached in January 1, 1974. However, ranchers had 2 percent fewer beef cows on hand this January compared to a year earlier, partially offset by 7 percent more heifers being held for beef cow replacement.

Class inventory and changes from a year ago are: beef cows 1.4 million--down 2 percent; milk cows, 28 thousand--up 4 percent; all heifers over 500 pounds, 397 thousand--up 12 percent, including heifers for beef cow replacement, 275 thousand--up 7 percent; steers over 500 pounds, 127 thousand, down 6 percent; bulls, 87 thousand--up 1 percent; calves under 500 pounds, 579 thousand--up 5 percent. The 1979 calf crop was estimated at 1.49 million head--3 percent more than last year's total.

All cattle and calves in the United States on January 1, 1980 totaled 111 million head--a fractional increase from last year's level but down 5 percent from January 1, 1978. This breaks the downward trend of the cattle cycle.

All cows and heifers that have calved numbered 47.8 million head--practically the same as January 1, 1979. The number on July 1, 1979 was 47.7 million--down 2 percent from July 1, 1978. The January 1, 1980 beef cows at 37.0 million are virtually unchanged from last year but down 5 percent from January 1, 1978.

PRODUCER CONTROLLED OFF-FARM WHEAT STOCKS

Montana wheat producers retained pricing control on 16.2 million bushels stored in off-farm facilities on January 1, 1980--74 percent of the total wheat stored off farm. A year ago, 15.0 bushels were producer-controlled--55 percent of the total off-farm stocks.

Producer-owned grain stored in commercial off-farm storage facilities is defined as grain for which the producer has some marketing control.

SHEEP NUMBERS INCREASE

Montana's sheep and lamb inventory increased 4 percent in 1979 and numbered 494,000 head as of January 1, 1980. Total stocksheep at 480,000 head were up 25,000 head from a year ago, but sheep and lambs on feed declined 30 percent to 14,000 head. The total value of all sheep and lambs in the State increased 7 percent to 45.2 million dollars. The average value per head at $91.50 compares with $89.00 per head in 1978.

Ewes one year old and older increased from 324,000 in 1978 to 343,000 head in 1979. Ewe lambs were also up at 117,000 head--a 5 percent increase from a year ago. Both ram and wether lambs and rams and wethers one year old and older were unchanged from a year ago at 9,000 and 11,000 head respectively. The 1979 lamb crop at 340,000 head was down 3 percent.

Nationally, the number of sheep and lambs on farms on January 1, 1980 totaled 12.5 million head. This is up 2 percent from the record low 12.2 million head a year earlier and the first increase in sheep numbers since 1960. The January 1, 1980 inventory value of all sheep and lambs climbed 11 percent to 974.1 million dollars.

AGRICULTURAL PRICES

Montana farmers and ranchers received slightly less for their products on January 15, 1980 compared with a month earlier. The January Montana index of farm prices received at 269 (1967=100) was down 2 points from the December index, but 24 points (10 percent) above a year ago. The all crops index at 246 was 18 points below the previous month but the index of all livestock and products was 288--up 9 points from a month earlier.

Between mid-December and mid-January, price drops were noted for all crop items except oats which remained the same. Most livestock items registered increases--except prices for steers and heifers, milk, eggs, and wool which declined.

Nationally, the January index of prices received by farmers decreased 4 points (2 percent) to 234 percent of its January-December 1967 average. Contributing most to the decrease since December were lower prices for corn, eggs, wheat, soybeans, turkeys, and cattle. Higher prices for broilers, rice and calves were partially offsetting. The index was 2 points (.9 percent) above a year ago.

MONTANA CHICKEN NUMBERS DOWN

The number of chickens on Montana farms December 1, 1979 totaled 890,000--down 4 percent from the 930,000 on farms a year earlier. The inventory included 599,000 hens and pullets of laying age and 286,000 pullets not of laying age. The inventory value of all Montana chickens December 1, 1979 increased 16 percent to $2,003,000. The average value per head at $2.25 was 40 cents more than the previous year.

Nationally, the number of chickens on December 1, 1979 at 400 million was up 1 percent. The inventory value rose 4 percent to $725 million.

CATTLE OUTLOOK

JOHN MARSH, ASSOCIATE PROFESSOR OF AGRICULTURAL ECONOMICS--MSU

January 1 total cattle and calf inventory shows a slight increase of 1 percent from 1979 to 1980 for Montana and roughly unchanged for the U. S. For Montana, cows and heifers that have calved declined during this time period by 2 percent and remained unchanged for the U.S.--indicating an expected calf crop of 1980 nearly equal to that in 1979. The figures are indicative that the latest cattle cycle has bottomed out and based on their respective 7 and 8 percent increase of heifers (500 Lbs. and over) kept for beef cow replacement, ranchers are in the process of herd rebuilding for the next few years. Montana's 38 percent increase in heifers kept for milk cow replacement reflects the increase in milk sales relative to production over the past few years; thus, providing the incentive for expansion.

For the U. S., the low of 110,864 (1,000 head) in 1979 corresponds to the previous low of 108,783 (1000head) in 1967, making the last cycle nearly 12 years in length. The previous low to 1967 was in 1958 at 91,176 (1,000 head), indicating that with cyclical inventories, the longrun trend in cattle numbers is increasing. From the trough of 1958 to the trough of 1967, cattle numbers increased 19 percent--yet slowed considerably from the trough of 1967 to the trough of 1979 at nearly 2 percent. For Montana, the cyclical aspects are not easily discerned, yet the growth rate has exceeded the national average. The previous low to 1979 was in 1962 at 2,133 (1,000 head); thus, indicating a growth from trough to trough of 22 percent. Prior to that, from the trough of 1950 to 1962, cattle numbers grew at a rate of 23 percent.

The next cattle cycle will be particularly critical for Montana and U. S. producers. This is in light of expected inflation and high energy costs. For the U. S., herd buildup from a point of low cattle numbers to its peak usually lasts 6-8 years under normal conditions, with the remaining 3-4 years consisting of cow herd liquidation. During the buildup stages of the 1958-1967 and 1967-1979 cattle cycles, cattle inventories increased at an average of 2.7 percent per year and peaked out in the mid-decades. Beef demand per capita increased about 1.7 percent annually during this period which apparently was sufficient to absorb increasing beef supplies at existing market prices. Feed grain supplies and prices, the impact of inflation and energy on production, and marketing costs plus ranchers' expectations about future cattle prices, will determine the buildup rate in the next few years. In order for beef demand to be brisk and meat sales to be adequate, the rate of growth of income, employment, and consumer confidence will be the key economic factors.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 97,000 gallons of ice cream during December--2 percent more than December 1978. Creamed cottage cheese output at 353,000 pounds was up 14 percent from a year ago. Butter production at 153,000 pounds was down 10 percent from last year.

INTENDED PLANTINGS UP

Montana farmers and ranchers' current spring planting intentions indicate a 7 percent increase in the acreage of the main spring-planted crops for 1980. A January survey revealed intentions to plant 4 percent more hard spring wheat, 16 percent more durum, 18 percent more barley, but 11 percent less oats, 6 percent less corn, and 1 percent fewer sugarbeets than planted in 1979.

Acreages finally planted could vary from these early intentions because of weather, economic conditions, and farm program participation, etc. Response by farmers to the survey was centered around January 1 with most questionnaires filled out and returned prior to the announcement on January 4 of the suspension of sales to the USSR. No attempt has been made to adjust or interpret any changes in reported intentions caused by the suspension action.

MONTANA HAS RECORD HONEY PRODUCTION

Montana's 1979 honey crop was a record high. Production estimated at 13,184,000 pounds was up 50 percent from 1978 and was over 3.6 million pounds above the previous record production of 9,520,000 pounds in 1976. The number of colonies in Montana at 103,000 was only 4 percent above last year but the yield per colony at 128 pounds tied the previous record set in 1942--the first year that records were kept. Montana ranked 6th among States in terms of production. Stocks of honey on hand for sale by Montana honey producers were 923,000 pounds on December 15, 1979--up 16 percent from the previous year on this same date.

The U. S. honey crop at 237 million pounds was up 3 percent from 1978. The number of colonies in the U. S. at 4.1 million was up 2 percent from 1978, while the yield per colony at 57.2 pounds was up less than a pound over the previous year. U. S. honey stocks were up 19 percent at 37.8 million pounds.

FEWER CATTLE ON FEED

Montana feedlots held 21 percent fewer cattle and calves this January 1 compared with a year earlier. There were 63,000 on feed for the slaughter market which broke down into 27,000 steers, 30,000 heifers, and 6,000 cows. Compared with last year, steers and heifers were each down 11 thousand, while cows being fattened for slaughter were up 5,000. Of the total steers and heifers, only 8,000 weighed over 900 pounds compared with 16,000 last year.

During the October-December 1979 quarter, 18,000 head were marketed for slaughter--5 percent under last year. Cattle and calves placed in lots during the quarter were down 19 percent at 58,000. Montana feeders expect to market 30,000 head in the January-March 1980 quarter, 9,000 more than this same period in 1979.

POTATO STOCKS DOWN

On January 1, 1980 Montana producers had 1.63 million cwt. in storage--13 percent below last year at this time.

Nationally, there were 182 million cwt. of potatoes in storage on January 1, 1980. This was a 7 percent decline from the record 196 million cwt. on hand a year ago but 3 percent above the comparable 1978 total.

MONTANA GRAIN STOCKS DOWN

Montana's all wheat stocks January 1, 1980 stored both on farms and in mills and elevators were 18 percent under a year ago. The decrease was caused by a 20 percent smaller crop in 1979 and a 37 percent greater disappearance during the October-December quarter compared with the same period the previous year. Total wheat stocks in all positions were 129.2 million bushels. Winter wheat in storage at 69.3 million bushels was down 19 percent from last year. All spring wheat at 59.9 million was down 16 percent with the durum portion at 8.4 million, also down 16 percent. Total wheat disappearance during the October-December quarter was 38.9 million bushels. Of the total wheat stocks, 83 percent was on farms, with the remainder in off-farm positions.

Barley stocks in all positions at 35.6 million bushels were down 29 percent from a year ago. Oats stocks at 7.3 million were off 33 percent.

Nationally, wheat stored in all positions on January 1, 1980 totaled 1.71 billion bushels, 5 percent more than last year's 1.63 billion bushels, but 14 percent less than two years ago. Farm stocks amounted to 772 million bushels or 45 percent of the total wheat stocks. Off-farm wheat stocks totaled 941 million bushels--15 percent more than a year earlier.

NOTE TO SURVEY RESPONDENTS

Some farmers and ranchers who return our questionnaires have specifically requested a copy of the results of the different surveys. However, a few have indicated they have not received the survey results. The Montana "Crop and Livestock Reporter", initiated Jan. 1979, includes results of most surveys conducted by the Montana Crop and Livestock Reporting Service. Prior to 1979, these were published in individual commodity reports.

ERRATA

Issue 79-24, December 27, 1979. In the table "1979 ANNUAL SUMMARY OF SMALL GRAINS", (Page 3)--barley production for 1979 should be 59,125 rather than 52,125.

MILK PRODUCTION INCREAS

Montana milk production in the fourth quarter (October-December) increased 3 percent over the same quarter the previous year. Dairymen produced 73 million pounds of milk in the 3 months, October through December--2 million pounds more than the same quarter in 1978. Average amount of grain fed to all cows in the herd on January 1 was 12.5 pounds per day--up 0.5 pounds from January 1 a year ago.

MONTANA SLAUGHTER UP

Montana slaughter plants produced 30 percent more red meat during December than the same month one year ago. Total production at 13.6 million pounds compares with 10.5 million pounds last December and 16.7 million pounds during November 1979. Production for all of 1979 at 161.9 million pounds was 11 percent more than the 1978 production of 145.9 million pounds.

Commercial red meat production for the United States during December 1979 totaled 3.08 billion pounds--down 1 percent from December 1978. January-December 1979 red meat production at 37.2 billion pounds was 2 percent below last year. Changes by individual components: beef, down 11 percent; veal, down 31 percent; pork, up 16 percent; lamb and mutton, down 5 percent.

FARM NUMBERS CONTINUE DECLINE

The number of farms and ranches in Montana during 1979 is estimated at 21,700--which indicates 300 operations have gone out of existence during the past year. For 1980, farm and ranch numbers are expected to decline about 200 to an estimated 21,500.

The amount of land in Montana farms and ranches during 1979 is estimated at 62.0 million acres--100,000 less than a year ago. Land in farms for 1980 is expected to remain unchanged.

The number of farms in the United States in 1979 is estimated at 2.33 million--down 1.6 percent from the 2.37 million in 1978. For 1980, farm numbers are expected to decline about 1 percent to 2.31 million.

Total land in farms was 1,049 million acres for 1979--a decline of 0.3 percent from a year earlier. The preliminary estimate for 1980 is 1,047 million acres--down 0.2 percent.

A farm is defined as a place which has annual sales of agricultural products of $1,000 or more. The estimates based on this definition are available beginning with 1975.

AGRICULTURAL PRICES

The December index of prices received by Montana farmers and ranchers decline 9 points (3 percent) from November. However, the index at 269 was still 39 points (17 percent) above December 1978. The reduction was mainly the result of a 12 point drop in the livestock and products index. Cow, steer and heifer prices were up slightly, but cows made up a larger share of the marketings and this pulled the composite price for all beef cattle down.

The all crops index at 258 dropped 4 points from November (1 percent) as grain and hay prices were down from the previous month.

(tables inside)

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 109,000 gallons of ice cream during November--2 percent less than November 1978. Creamed cottage cheese output at 383,000 pounds was up 12 percent from a year ago. Butter production at 166,000 pounds was down 3 percent from last year.

CATTLE ON FEED REPORTS AND MARKET PRICES

Do USDA's Cattle on Feed reports affect cattle prices? Some cattlemen say prices typically fall because of the reports. However, the facts don't support that assumption. The only way to determine once and for all how prices have reacted after the reports is to examine the record, and that's just what the Crop Reporting Board did.

Of course, how often prices rise or fall doesn't settle how much of the credit or blame actually belongs to the reports, but it's a good start.

The table analyses changes in Choice steer prices at Omaha following each of the quarterly Cattle on Feed reports issued from 1975 to 1978. All prices are weekly average prices per cwt. By averaging out daily price fluctuations, weekly prices help differentiate fundamental price effects from the effects of daily supply disruptions due to weather, holidays, and other "spurious" factors.

Total net change ($ per cwt.):					-0.09	+0.56

[1]Weekly average cash prices per cwt. for Choice slaughter steers, 900-1,100 pounds, at Omaha. (Source: AMS Market News)

Probably the first thing to note from the table is that prices increased as often, or more often, than prices decreased for the 16 reports combined.

Looking at price changes from the week before the reports were issued to the week of issuance, weekly average prices rose eight times and dropped eight times. From the week of release to the week after, prices went up nine times and dropped only seven times.

In dollar terms, the total net change for all the reports combined was a loss of 9 cents per cwt. from the week before to the week of release. However, the net change in price from the week of release to the week after was an increase of 56 cents. The table makes another important point: that no consistent relationship is apparent between the direction of change in cattle on feed numbers and the direction of change in prices. Of course, it is difficult to know what specific piece of information, if any, in each report may have had some effect on prices. However, in the absence of other market factors, it would seem reasonable that increases in reported inventories would result in price declines and that decreases in inventories would boost prices.

The evidence shows no such relationship. Looking at 1976 for example, the January 20 report showed the inventory of cattle on feed to be up 28 percent from the previous year. Assuming that markets were reacting only to this information, the price response following that report would seem logical. However, after the April 16 report, which showed the same 28 percent increase in cattle on feed numbers, prices reacted in the opposite way. Cash prices which had averaged $41.10 per cwt. the week before the report jumped $2.40 to $43.50 for the week the report came out. Then they rose another $1.10 the next week.

From the table, it's clear that cattle prices may either rise or fall after Cattle on Feed reports, regardless of whether the cattle on feed inventory is up or down. This suggests that the reports are not the sole and direct cause of price fluctuations--even on a very shortterm basis.

The conclusion: While the relative price influence of the reports among other market factors may be debatable, the record of how prices have responded following the reports isn't. At least for the quarterly reports, the record shows that prices have risen as much and as often, as they've declined after the reports were issued. It also shows that there's no reason to assume that reports indicating increased numbers of cattle on feed will mean a drop in prices.

Obviously, any information contributing to the overall picture--including cattle on feed numbers, placements, and marketings--can affect the relative bargaining positions of cattle buyers and sellers.

Consequently, because the price reaction after Cattle on Feed reports does not appear to follow a logical pattern (prices moving in the opposite direction of cattle on feed numbers) that does not mean that the reports have no effect on the market.

Many analysts describe the relationship between the reports and prices in terms of an "announcement effect".

(continued on back page)

The announcement effect theory suggests that price movements immediately following the release of a report indicate how accurately the private sector has anticipated the information that's in the report. In other words, the cattle market will react only to the degree to which it is surprised by what the report shows.

If the information released was correctly anticipated by market participants, prices might still respond to other factors but not to the report itself. Likewise, an increase in cattle on feed numbers could easily have the seemingly illogical effect of boosting prices if the increase was smaller than the trade expected.

Although the announcement effect might help analysts explain why prices frequently react in the same direction as reported cattle on feed numbers, the most important consideration for the cattleman is the actual record of price response.

That record is clear: for whatever reasons over the last 4 years cattle prices have risen more often, and by a greater dollar amount, than they've fallen following USDA's Cattle on Feed reports.

HAY STOCKS

January 1 hay stocks on Montana farms and ranches totaled 3,819,000 tons--4 percent less than on the same date last year. Hay supplies appear ample and a mild open fall enabled some late grazing. However, many farmers and ranchers had to start early supplementary feeding, even though grazing was open. Late pasture and range conditions in most areas of the State were not too good due to lack of moisture during the past summer and fall.

The United States hay stocks on farms January 1 totaled 106.8 million tons--9 percent above a year earlier.

LIVESTOCK SLAUGHTER UP

Montana slaughter plants produced 26 percent more red meat during November than the same month one year ago. Total production at 16.7 million pounds compares with 13.3 million pounds last November and 17.5 million pounds during October 1979. Production for the first eleven months of 1979 at 148.3 million pounds is 10 percent more than for the same period a year ago.

Commercial red meat production for the United States during November 1979 totaled 3.31 billion pounds--down 1 percent from November 1978. January-November red meat production at 34.2 billion pounds was 2 percent less than last year. Changes by individual components: beef, down 12 percent; veal, down 32 percent; pork, up 16 percent; lamb and mutton, down 5 percent.

POTATO STOCKS

On December 1, 1979 Montana producers had 1.65 million cwt. in storage--13 percent below last year at this time.

Nationally, there were 209.2 million cwt. of potatoes in storage on December 1, 1979--6 percent less than a year earlier.

EGG PRODUCTION

Layers in Montana produced 40 million eggs in the period September 1 through November 30. This is down 8 million from the same period last year. The number of layers on hand as of December 1 was 599,000--down 19 percent from last year. The main reason for the decline is that a large number of layers had to be destroyed becaused of PCB contamination during the September 1 to November 30 period. Approximately 5.8 million of the 40 million eggs produced during the quarter also had to be destroyed due to PCB contamination.

Nationally, 17.0 billion eggs were produced in the September-November quarter. This is a 1 percent increase over last year. Layers on hand December 1, at 291.9 thousand, were down slightly from the previous year.

MONTANA HOG NUMBERS DOWN

Montana producers had fewer hogs and pigs on hand December 1, 1979 than a year earlier. The Montana inventory of 209,000 was 6 percent below last year. Market hogs at 181,000 were also down 6 percent, while breeding hogs at 28,000 were down 3 percent. Part of the inventory reduction is due to PCB contaminated hogs that had to be destroyed. Approximately 4,000 head were destroyed during September 1, 1979 to December 1, 1979 period according to the Montana Department of Health.

The state pig crop for 1979 totaled 308,000--down 7 percent from the previous year. The spring pig crop (December-May) at 155,000 was down 10 percent from a year earlier, but was 8 percent above December-May 1977. The fall pig crop farrowed during June-November at 153,000 was down 3 percent from a year ago, but 6 percent above 1977.

Nationally, the December 1 hog inventory is estimated at 67.0 million head, an 11 percent increase from last year. Breeding stock was virtually unchanged, but market hogs were up 14 percent from last year. The spring pig crop (December-May) estimated at 50.7 million head is up 19 percent from a year earlier. The fall pig crop (June-November) estimated at 52.1 million head is 13 percent more than a year ago.

Nationally, hog producers intend to farrow 7.18 million sows during the December 1979-May 1980 period--about the same number as a year ago.

1979 ANNUAL SUMMARY OF SMALL GRAINS

Montana's total small grain production for the 1979 crop season totaled nearly 162.5 million bushels--25 percent less than a year ago according to final end-of-season figures. The smaller output was mostly because of lower yields per acre, as harvested acreage fell only 2 percent. Rainfall was below average in almost all locations in the state.

Total wheat production at 116.5 million bushels was down 20 percent. Winter wheat at 57.4 million fell 31 percent; durum at 6.8 million bushels was off 22 percent; and hard spring wheat at 52.3 million was down 3 percent. The relatively small decrease in spring wheat production was due to the large amount of winter wheat lost to "winter kill" and reseeded to spring wheat.

Barley production at 40.6 million bushels was down 31 percent and oats at 5.4 million was down 49 percent from 1978.

All wheat production for the nation totaled 2.1 billion bushels--up 19 percent from 1978. U. S. barley production at 378 million bushels was down 16 percent and oats production at 534 million bushels was down 10 percent from last year based on after harvest surveys.

End of season statistics for other crops will be released January 15, 1980.

MONTANA WINTER WHEAT SEEDINGS DOWN

Montana farmers planted 2.6 million acres of winter wheat this past fall for harvest in 1980--a decrease of 13 percent from last year's seedings. Based upon farmer-reported condition of the crop on December 1, the estimate for 1980 production is 72.8 million bushels--up 27 percent from 1979. The low production level this past year was due to the large loss of acreage from winter kill and drought reduced yield. Winter wheat was seeded this past fall under generally dry conditions and good winter and spring moisture is needed for spring growth and development

Nationally, growers seeded 56.8 million acres of winter wheat in the fall of 1979 for the 1980 crop. This is 9 percent more than last year's 51.9 million acres and 19 percent more than the acreage planted two years ago. Winter wheat production for 1980 based on condition of the crop on December 1, 1979, is forecast at 1.57 billion bushels--3 percent less than the production in 1979. Seeded yield is forecast at 27.6 bushels per acre. In comparison, last year's average was 31.0 bushels per planted acre.

AGRICULTURAL PRICES

Prices received by Montana farmers in November were down from October. The November index of all farm products at 278 (percent of 1967) was 7 percent below October but still 22 percent above last year. Declining livestock prices pulled the livestock price index down 10 percent from last month. The index of prices received for crops was down 1 percent. Compared with a year ago, the livestock index stands 19 percent higher and crops are up 30 percent.

Individual commodity prices averaged no change for wheat, feed grains were down, and hay was up from last month. Cattle and calf prices averaged $4 to $5 per cwt. lower. Hogs fell off about $2 and wool was also down. These lower prices were only slightly offset by higher sheep, lamb, milk, and egg prices.

Nationally, the November index of prices received by farmers increased 1 point (1/2 percent) to 237 percent of its January-December 1967 average. Contributing most to the increase since October were higher prices for broilers, eggs, oranges, tomatoes, and milk. Lower prices for cattle, corn, grapefruit, lemons, and wheat were partially offsetting. The index was 21 points (10 percent) above a year ago.

The mid-month index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates was unchanged from October at 256. Lower prices for livestock feeds were offset by higher prices for other production items and the family living component. The index was 31 points (14 percent) above a year ago.

PASTURE AND RANGE

Most parts of the State had a reduced condition from November and grazing generally remained open in most areas. The December 1 condition averaged 66 percent--2 points below November and 23 points below a year ago.

1978 FARM INCOME UP

Montana farmers and ranchers received nearly $1.4 billion in cash receipts from farming and ranching in 1978. Cash receipts were up 33 percent from 1977. However, expenses were up 18 percent. After expenses, Montana farm and ranch families had $297.6 million left as realized net farm income. Divided between the 23,000 farms and ranches in Montana, net income amounted to $12,938 per farm. This compares with $5,572 per operator in 1977.

Cash receipts from the sale of livestock and livestock products accounted for more than half the total receipts and were 38 percent above 1977. Crops brought in 17 percent more than the previous year. Government payments were more than double 1977 but represented only 10 percent of cash receipts.

MANUFACTURED DAIRY PRODUCTS

. Montana dairy plants manufactured 148,000 gallons of ice cream during October--6 percent more than October 1978. Creamed cottage cheese output at 448,000 pounds was up 26 percent from a year ago. Butter production at 175,000 pounds was up 12 percent from last year.

LIVESTOCK SLAUGHTER UP

Montana slaughter plants produced 33 percent more red meat during October than the same month one year ago. Total production at 17.5 million pounds compares with 13.2 million pounds last October and 15.3 million pounds during September 1979. Production for the first ten months of 1979 at 131.6 million pounds is 8 percent more than for the same period a year ago.

Commercial red meat production for the United States during October 1979 totaled 3.56 billion pounds--up 6 percent from October 1978. January-October meat production at 30.9 billion pounds was 3 percent less than last year. Change by individual components: beef, down 11 percent; veal, down 32 percent; pork, up 15 percent; lamb and mutton, down 6 percent.

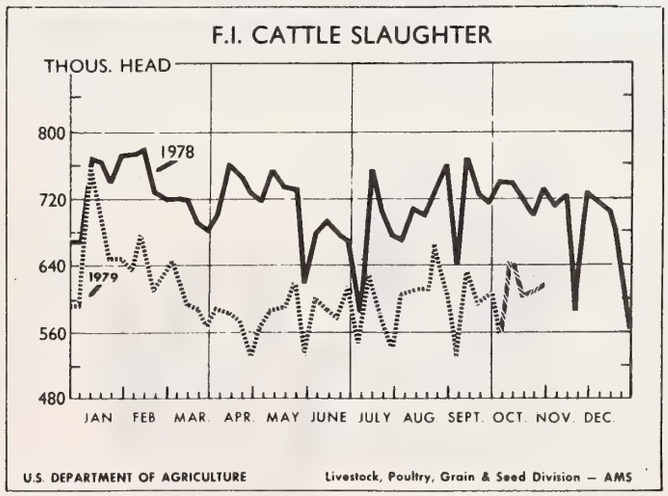
FEED GRAIN PRICES STRONG DESPITE RECORD SUPPLY

Feed grain prices in 1979/80 are expected to average higher than last year despite the record large supply. The total of domestic use and exports likely will be more than the record 1979 feed grain production, which will reduce stocks moderately by the end of the 1979/80 marketing year. Current estimates indicate domestic use of feed grains will be about 157 million tons--an increase of 3 percent from last year. This volume would be near the all-time high domestic use of feed grains in 1972/73. The increase over last year will be due mainly to continued heavy hog and poultry feeding.

Exports are expected to total about 71 million metric tons--11 million tons (18 percent) more than the record exports of 60 million tons in 1978/79. The export market is strong because total world grain production (wheat, coarse grains, and rough rice) this year is about 4 percent below last year's record harvest. World production of coarse grains outside of the United States is down 5 percent from 1978/79--mainly reflecting the much smaller Soviet crop. Some countries are maintaining or expanding their feeding operations by importing grain to make up for shortfalls in their crops. The large U.S. grain supplies, along with the smaller supplies and logistical difficulties that hinder exports in some other grain exporting countries, and favorable rates for some foreign currencies in exchange for the U.S. dollar are making U.S. crops attractive to foreign grain buyers.



SPRING WHEAT VERSUS WINTER WHEAT IN MONTANA

Montana is rather unique among States in producing large amounts of both winter wheat and spring wheat. And some of our southern neighbors are quite surprised that winter wheat can be grown successfully this far north. South Dakota is the only other State growing nearly equal amounts of these two wheats, but in smaller quantities. There have been changes in the proportions of winter wheat and spring wheat grown in Montana over the years. Up to the late 1950s, spring wheat acreage was usually double that of winter wheat, but they were nearly equal in 1958, and for several years "seesawed" back and forth. Since 1973, fall-seeded wheat has exceeded the spring in Montana--by 46 percent in 1978.

The traditional wheat class areas (spring wheat, northeast and northern Triangle; winter wheat, "Triangle", central Montana and south-central) continue, but winter varieties have crept further north and east over the years. In the early 1950s, the area north of the Marias River was "spring wheat country" but that's no longer true--winter wheat is now grown to the Canadian line. The change has been dramatic in several counties. The northern Triangle counties of Toole, Liberty, Hill, and Blaine were almost entirely spring wheat in 1950--only 2 percent winter wheat in Toole, 8 percent in Liberty, and less than 1 percent in Hill and Blaine counties. However, by 1978 winter varieties predominated, with 51 percent in Toole, 72 percent in Liberty, 81 percent in Hill, and 65 percent in Blaine. The rise in winter wheat acreage has not been constant--the late 1960s saw a rise in the percent winter wheat in these counties, but this slipped in the early 1970s. Perhaps weather was a factor.

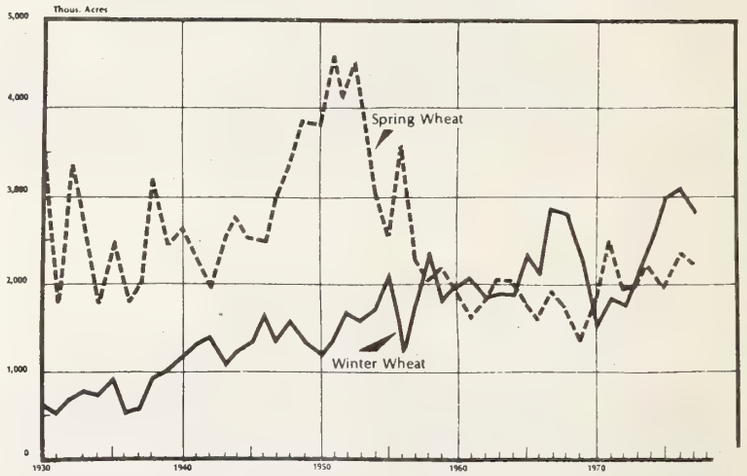
Five other counties in eastern Montana, Phillips, McCone, Dawson, Fallon, and Richland, also show significant increases in percent winter wheat the past 29 years. These all had minor amounts of winter wheat in the early 1950s but had increased to over 40 percent by 1977 or 1978.

The large winter wheat winterkill in 1979 in Montana and the dry fall of 1979 for the 1980 crop may mean some temporary shifting back towards spring wheat; but probably not in the longrun. Winter wheat yields averaged nearly 25 percent higher than spring wheat for the State the past 10 years and greater in some counties. When and where possible, growers mostly prefer winter wheat.

There are a number of reasons for this shift toward winter wheat including improved wheat varieties, fertilizer, better tillage practices, etc. These can be credited to research by plant breeders and agronomists, and a willingness by producers to accept new varieties and practices. The net effect has been a significant increase in value of wheat production just due to this shift in varieties--approximately 325 million dollars over the last 30 years or an average of about 11 million dollars per year. The dollar effect was, of course, smaller in earlier years and largest recently.

ACRES HARVESTED

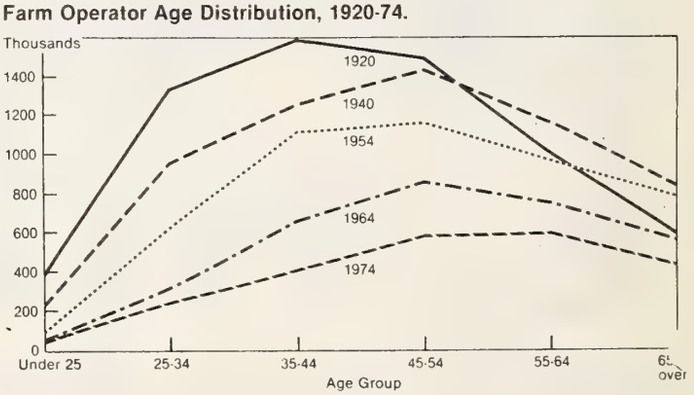
All Spring and Winter Wheat, 1930-1977



FARM OPERATOR ENTRY AND EXIT

Farm numbers and sizes adjust as individuals choose to enter or leave farming and as existing operators focus decisions on changes in size. These decisions are importantly related to the aging of existing operators. Historically, most people have begun farming before their 35th birthday, expanded the size of their operations over time, and then after age 55 begun to decrease the size, or at least stopped growth. They quit farming at some later point either through retirement or death.

Farm Operator Age Distribution, 1920-74.



CONSUMER PRICE INDEX

The October CPI for all urban consumers 1967 base was 225.4. This was up 0.9 percent (2.0 points) from September and up 12.2 percent (24.5 points) from October 1978.

HOG SLAUGHTER AND PRICES

For the past eight months, hog prices have been disastrously depressed. The reasons are known by most--large supply and slaughter of hogs and some competition from poultry. There is a noticeable inverse correlation between hog prices and slaughter--as slaughter goes up, prices react downward.

Sharp changes in slaughter and prices have happened in 1979 in contrast to the prior two years when slaughter and prices were more stable. In fact, some observers had questioned whether hog cycles would disappear--obviously they haven't. The following chart points out the relationship of prices to slaughter for the past two years.

LAND USE

As indicated by the chart below, most of the irrigation in the United States is in the 17 Western States.

Approximately 12 percent of the nation's harvested cropland is irrigated, and that acreage accounts for about 27 percent of the value of total harvested crop production. In addition several million acres of pastureland are irrigated.

In irrigated agriculture, the cost of energy for pumping is a large and continually increasing expense. The latest data show that electricity is the leading source of power for pumping (42 percent)--followed by natural gas (32 percent).

FARM LABOR

The total number of workers on Montana farms and ranches during the week of October 7-13, 1979 was estimated at 26,000--18 percent below October 1978. Farm operators plus unpaid family members working 15 hours or more per week were down 35 percent from last year, but hired workers at 9,000 were up considerably from October 1978.

NOTABLE NUMBERS

Montana's average all wheat yield in 1945 was 15.1 bushels. Thirty-three years later in 1978, it had climbed to 30.2 bushels.

PASTURE AND RANGE

Light, but general precipitation the last half of October helped pasture and range conditions. The November 1 condition averaged 68 percent--2 points above the October 1 condition, but still 28 points below last year's unusually good condition. The November 1 condition is 13 points below the 10-year average.

STATE	69	96	68

LOWER PORK AND POULTRY PRICES FORECAST

Retail pork and poultry prices are expected to average well below year-earlier levels during the first half of 1980, but beef prices will be slightly higher. At the same time, lower hog and broiler prices will squeeze producer profits. These price forecasts are based on anticipated record-high levels of red meat and poultry production, very large feed grain supplies, and a slowing in the growth of consumers' incomes.

Current prospects suggest a substantial increase--possibly to record levels--in both pork and broiler production this fall and during the first half of 1980. Beef production is expected to be well below 1978 levels during the fall but will probably average near year-earlier production in the first half of 1980. Retail pork and broiler prices are expected to continue to decline this fall, while beef prices may average near the summer quarter level.

WHEAT CARRYOVER NOW ESTIMATED SLIGHTLY HIGHER

The national estimates of domestic and export utilization of wheat during this current crop year are shown in the table below.

These latest data indicate a carryover of about 850 million bushels of wheat as of May 30, 1980. This carryover estimate is slightly higher than estimated several months ago due to a downward change in the amount of domestic use. Current indications are that less will be used for feed this year because of the level of wheat prices and availability of other feeds.

A brief explanation of the data which form this supply and utilization summary may be appropriate---(1) beginning stocks, based upon surveys of producers and elevators June 1, 1979, (2) production, latest U.S. forecast on national wheat production based upon producer reports and Objective Yield measurements (this could be changed slightly when final 1979 wheat figures are released in late December), (3) imports, recorded and projected from custom inspections, (4) domestic use, the department's best estimate of use for feed, seed, and flour based upon past history and utilization to date, (5) exports, the department's best estimate based upon shipments to date and projected orders and shipments, and (6) the projected ending stocks are based on the total supply less the total of expected use.

Although these components are subject to change, they represent the best data at the present time on the expected carryout. In the past, the expected carryout and actual carryout were an important factor in current and future wheat prices.

FERTILIZER CONSUMPTION UP

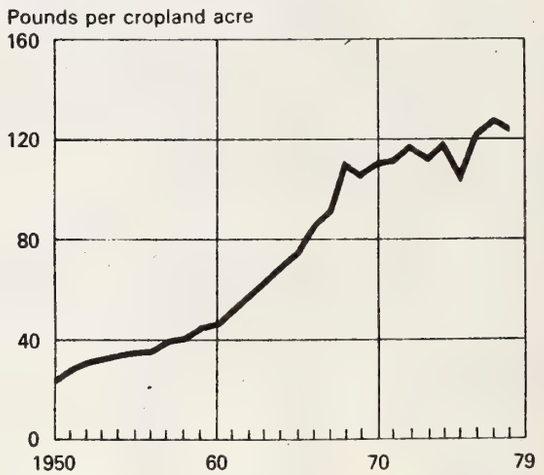
Fertilizer consumption in Montana totaled 333,834 tons for the July '78 - June '79 period, up 34 percent from the previous year. Of this total, mixed fertilizer accounted for 166,565 tons, while 160,131 tons was primary nutrients and 7,138 was secondary and micronutrients used in direct application materials.

Fertilizer consumption in the U.S. and Puerto Rico during the year ended June 30, 1979 is placed at 51.0 million tons--up 7 percent from the 47.5 million tons consumed during the 1977-78 year. Primary nutrient content (nitrogen, N; phosphate, P_{205}; and potash, K_{20}) was 22.4 million tons--up 9 percent from a year earlier. Nitrogen consumption increased 7 percent to 10.6 million tons; phosphate usage increased 9 percent to 5.5 million tons; and potash at 6.2 million tons was up 12 percent.

The five leading States in order of total consumption and the change in consumption from last year were: Illinois, up 17 percent; Iowa, up 20 percent; California, down 6 percent; Indiana, up 3 percent; and Texas, up 8 percent.

Fertilizer consumption represents all commercial fertilizer tonnage sold or shipped for farm and non-farm use as fertilizer. Materials used in the manufacture of registered mixes or for use in other fertilizers are excluded.

Fertilizer Nutrients Used per Acre



AGRICULTURAL PRICES

The October 1979 index of prices received by Montana farmers declined 1 point (less than 1 percent) from September. The index at 294 percent was still 62 points (27 percent) above last year. The reduction was caused by a 4-point drop in the all crops index. Barley averaged 23 cents per bushel below last month and winter wheat was off 7 cents. Durum wheat moved strongly upward and registered 33 cents above September. Other spring wheat was up 13 cents. But these increases only partially offset the barley and winter wheat decreases.

The livestock and livestock products index edged up 1 point from September. Meat animals averaged no change, but dairy products, poultry, eggs, and wool advanced. Within the meat animal index, changes were mixed as cattle and calf prices moved higher--but sheep, lambs, and hogs moved down from September. Compared with a year ago, hog prices were 30 percent lower but beef cattle were up 32 percent.

WHO'S BUYING WHAT

Our top market, Japan, will take more feed grains, soybeans, beef, and poultry, but probably less cotton next year. A bigger Japanese wheat crop could hold U.S. wheat shipments near this year's levels.

Led by wheat and feed grains, our export sales will notch some of their biggest gains in the USSR, where total food and feed grain production may be down about a fourth from last year.

While grain production may be down 7 percent in Eastern Europe this year, the Soviet bloc countries are committed to expanding meat production. This augurs well for U.S. feed grain exports to this region--particularly Poland.

China, on the other hand, produced a record grain crop this year. China also faces massive bills for imported industrial products. Therefore, look for the Chinese to buy less U.S. grain in coming months.

Western Europe, traditionally a top U.S. farm market, will import more wheat, feed grains, cotton, beef, and poultry meat.

The oil-rich OPEC countries are a growing market for our farm products, and their agricultural purchases from us should hit a record $2.6 billion this year and continue climbing in 1980. Leading OPEC imports include food and feed grains, soybeans, inedible tallow, and poultry.

But as rising oil prices expand our OPEC markets, they lower export prospects in a number of fast developing but oil-dependent nations like South Korea, Taiwan, and Brazil.

Escalating petroleum prices could push other developing countries to seek more food aid from the United States. Bear in mind, however, that a farmer gets the same price for his products whether they're exported commercially or shipped abroad under P.L.480.

SEPTEMBER LIVESTOCK SLAUGHTER

Montana slaughter plants produced 18 percent more red meat during September than the same month one year ago. Total production at 15.3 million pounds compares with 12.9 million pounds last September and 16.4 million pounds during August of 1979. Production for the first nine months of 1979 at 114.1 million pounds is 5 percent more than for the same period a year ago.

Commercial red meat production for the United States during September 1979 totaled 2.88 billion pounds--down 8 percent from September 1978. January-September red meat production at 27.3 billion pounds was 4 percent below last year. Change by individual components: beef, down 12 12 percent; veal, down 33 percent; pork, up 13 percent; lamb and mutton, down 6 percent.

MILK PRODUCTION DOWN

Montana milk production in the third quarter (July-September) increased over the previous quarter but failed to reach last year's level. Dairymen produced 79 million pounds of milk in the 3 months July through September--1 percent less than the same quarter last year. Average amount of grain fed to all cows in the herd on October 1 was 12.0 pounds per day--the same as last October.

MORE CATTLE ON FEED

Montana feedlots had slightly more cattle and calves on feed for the slaughter market on October 1 than on the same date last year. This year's number at 32,000 compares with 30,000 a year ago. Steers on feed were up 27 percent, while heifers were down 6 percent. Seventy-five percent of the feedlot cattle weighed 900 pounds or more compared with 63 percent last year. Fall calf marketings were not yet active before October 1 so few calves from the current calf crop had been placed in feedlots. Only about 1,000 head in current lots weighed less than 700 pounds. Placements the last 3 months at 11,000 head were 5,000 less than last year. Marketings during the same period at 25,000 head were down 11,000. Montana feeders expect to market 22,000 head during the October-December quarter--up 16 percent from the same period last year.

MONTANA GRAIN STOCKS DOWN

Wheat stored on Montana farms and in mills and elevators on October 1 was 9 percent under the stocks in storage a year ago. The decrease, due to this year's 20 percent smaller wheat crop, was partially offset by more of the current crop going into storage than last year. Transportation has been a problem.

Total wheat stocks in all positions totaled 168.2 million bushels. Winter wheat in storage at 85.1 million bushels was down 15 percent from last year; all spring wheat stocks at 83.0 million bushels were off 3 percent; with the durum portion at 8.9 million bushels, down 35 percent. Disappearance of wheat since June 1 totaled 36.2 million bushels--38 percent less than the same period a year ago. Of the total State wheat stocks, 84 percent were stored on farms--with the remainder in mills and elevators.

Barley stocks in all positions at 47.7 million bushels were down 18 percent from last year and oats stocks at 10.6 million were off 14 percent; both due to reduced 1979 production.

Nationally, wheat stocks in all storage positions on October 1, 1979 totaled 2.29 billion bushels--7 percent larger than last year. Farm storages contained 1.01 billion bushels of wheat, 44 percent of the total 1979 stocks, while the remainder in off-farm storage amounted to 1.28 billion bushels. Last year, farm storage held 1.03 billion bushels, and off farm storage had 1.10 billion bushels. Disappearance of all wheat during the June-September period totaled 749 million bushels compared with 838 million bushels last year.

ALFALFA SEED PRODUCTION UP

Montana's 1979 alfalfa seed crop is forecast at 3.2 million pounds--up 44 percent from last year's reduced crop. Acres for harvest at 29,000 are up 12 percent and yield per acre at 110 pounds is up 25 pounds from last year. Weather conditions were good for alfalfa seed production and a dry, frost-free harvest season helped boost yields. More growers are using leafcutter bees for pollination, which can influence yields.

The United States alfalfa seed crop forecast at 105.5 million pounds is 14 percent above last year. Acreage for harvest at 526 thousand acres is down 1 percent from 1978. Yields are expected to average 201 pounds per acre--up 26 pounds from last year.

PASTURE AND RANGE

September precipitation was below normal and temperatures were above normal--resulting in poor pasture and range conditions across the State. The October 1 condition of 66 was 3 points below last month and 31 points below last year's unusually favorable conditions.

HONEY PRODUCTION DOWN

Honey production from apiaries with 300 or more colonies in 20 selected States is expected to decline 2 percent to 144 million pounds in 1979. The estimated 1.95 million colonies of bees held by the apiaries in 1979 are 2 percent above the 1978 level of 1.92 million colonies.

Colony yield is expected to decline an average of 2.8 pounds for the 20 States compared with last season. California yield declined to a more normal level from last year's unusually good yield. Nebraska, North Dakota and South Dakota honey flows were reduced by cooler summer temperatures and aerial grasshopper spraying. In addition, Nebraska honey flow was reduced by poorer alfalfa bloom. Florida orange blossom flow was very good again in 1979 providing good yields and quality. Montana yields came from an above average sweet clover nectar flow.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 217,000 gallons of ice cream during August--7 percent more than August 1978. Creamed cottage cheese output at 488,000 pounds was up 45 percent from last year. Butter production at 101,000 pounds was down 19 percent from last year.

OCTOBER 1 CROP REPORT

Montana's all wheat crop should total 117.2 million bushels--20 percent less than last year. This estimate based on an October 1 survey is 2 percent above the September 1 forecast. Ideal fall weather helped move the harvest along and combining of most of the spring wheat, oats, and barley was finished by the first of October. Final production figures for the state based upon a much larger survey, will be released in December.

Montana's winter wheat production at 58.0 million bushels is off 30 percent from a year ago, spring wheat at 53.6 million bushels is essentially unchanged, durum at 4.9 million bushels is down 43 percent, barley at 37.8 million is down 33 percent, and oats at 7.4 million is down 30 percent.

The season's first production forecast for potatoes indicates a total of 1,656 thousand hundredweight, down 21 percent from last year--mainly because of fewer acres for harvest. Sugarbeet production at 825 thousand tons is down 7 percent. Dry bean production is expected to total 155 thousand hundredweight--up 23 percent from last year. All hay production forecast at 4.2 million tons October 1 is down 9 percent from a year ago. These forecasts are all unchanged from September 1.

Sweet cherry production for 1979 is now estimated at 2,950 tons based upon shipments--59 percent more than last year.

WHO OWNS THE LAND?

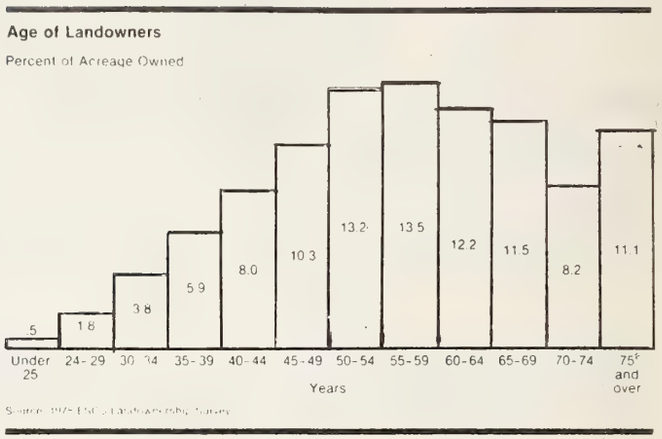
Just who is in control--particularly of farm and ranch land. The preliminary results of a recent USDA survey provide some answers.

The total U.S. land area excluding Alaska is approximately 2.3 billion acres--about 60 percent of this is in private hands and 40 percent is owned by Federal, State, or local governments. I assume the concentration of government land is highest in the western States. Farm and ranch operators are the largest single group owning private land, accounting for nearly 40 percent. Ownership by other occupations shows retired persons with 15 percent; white collar employees 13 percent; blue collar workers 8 percent; and 9 percent classified as other. Corporations and large partnerships which may include occupations listed account for 15 percent of the land owned. This breakdown does not determine foreign ownership.

Farm and ranch land which totals about 871 million acres comprises 70 percent of all private land. The ownership of land in farms and ranches by occupation shows 50 percent of the acreage owned by farm and ranch operators; 12 percent by white collar workers; 7 percent by blue collar workers; 15 percent by retired persons; 12 percent by corporations and large partnerships; and 4 percent by others. By regions, farm and ranch operator ownership is highest in the mountain and western States and lowest in the Apalachian and southeast States.

Ownership of farm and ranch land by type of owner shows sole proprietors and husband and wife 74 percent; family partnerships and family corporations 18 percent; nonfamily partnerships and corporations 4 percent, with 3 percent classified as miscellaneous.

The breakdown of farm and ranch land by size of holdings shows 1 percent of the owners with 29 percent of the farm and ranch acreage and 5 percent of the owners with 51 percent of the acreage. So a sizable acreage is in the hand of large operators.



AGRICULTURAL PRICES

Montana farmers received higher prices for most crop and livestock items at mid-September compared with a month earlier. The overall September index of prices received by Montana farmers at 291 (1967=100) compares with 254 for August and 229 a year ago.

Cattle on Feed
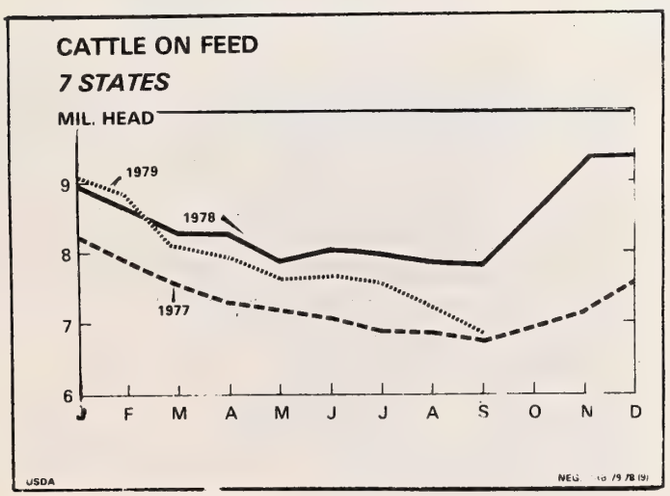
Sept 1 Hog & Pig Inventory

NOTABLE NUMBERS

Montana ranked fifth nationally in acreage of winter wheat seeded for the 1979 crop--exceeded only by Kansas, Oklahoma, Texas, and Colorado.

CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed September 1 for slaughter market in the 7 States preparing monthly estimates totaled 6.84 million head--down 13 percent from a year ago but 2 percent more than September 1, 1977. Marketings of fed cattle during August totaled 1.63 million--down 3 percent from last year but 2 percent above August 1977. Placements of cattle and calves on feed in the 7 States during August were 1.34 million, down 24 percent from last year and 11 percent less than August 2 years ago. August placements are the lowest since 1975. Net placements of 1.26 million were off 23 percent from last year and 13 percent from 2 years ago. Other disappearance totaled 82 thousand compared with 115 thousand in August 1978 and 58 thousand in 1977.



LIVESTOCK SLAUGHTER

Red meat production by Montana slaughter plants totaled 16.4 million pounds during August 1979. This is 14 percent more than August 1978 production and 16 percent more than the July 1979 figure. Production for the first eight months of 1979 at 98.8 million pounds is 3 percent more than for the same period a year ago.

Commercial red meat production for the United States during August 1979 totaled 3.33 billion pounds--up 2 percent from August 1978. January-August red meat production at 24.4 billion pounds was 3 percent below last year... change by individual components: beef, down 11 percent; veal, down 33; pork, up 14; lamb and mutton, down 6 percent.

Red meat production	14,365	16,432	3,274	3,328

HOGS AND PIGS

SEPTEMBER 1 INVENTORY--Inventory of hogs and pigs on September 1, 1979 in the 14 States conducting quarterly hog surveys was estimated at 57.0 million head--up 16 percent from a year ago according to the Crop Reporting Board. This is the largest September 1 inventory since 1970.

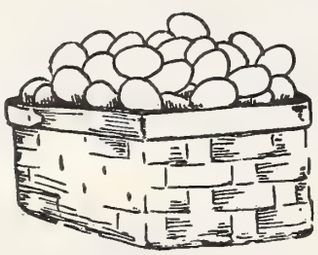
---Breeding inventory at 8.24 million head was up 10 percent from 1978 and up 15 percent from 1977.

---Market hog inventory totaled 48.8 million head--17 percent above last year and 16 percent more than 1977.

The 14 Quarterly States account for about 86 percent of the U.S. hog and pig inventory.

PIG CROP (JUNE-AUGUST 1979)--The June-August 1979 pig crop in the 14 States totaled 22.3 million head--16 percent higher than 1978 and 19 percent above 1977. A total of 3.11 million sows farrowed in these States--up 17 percent from last year. Pigs saved averaged 7.16 for the quarter compared with 7.22 pigs per litter for both 1978 and 1977.

FARROWING INTENTIONS--Producers in the 14 States intend to farrow 3.16 million sows during the September-November 1979 period--13 percent more than 1978 and 23 percent above 1977. Farrowing intentions reported for the December 1979-February 1980 period are 2.93 million sows--10 percent more than a year earlier and 28 percent more than two years ago.



EGG PRODUCTION

Montana's laying flocks produced 45 million eggs during the June 1 - August 31, 1979 quarter--down 10 percent from the same period a year ago. The number of layers on September 1 at 790,000 was down 2 percent from last year. Rate of lay on September 1 averaged 64.0 eggs per 100 layers compared with 70.0 a year earlier.

The Nation's laying flocks produced 17.0 billion eggs during the June 1 - August 31, 1979 period--up 3 percent from the same quarter a year ago. The number of layers on September 1 at 281 million compares with 278 million a year earlier. Rate of lay on September 1 averaged 65.5 eggs per 100 layers compared with 65.2 on the same date a year ago

PUBLIC MEETINGS ON "STRUCTURE DIALOGUE"..... Secretary of Agriculture, Bob Bergland, along with other top USDA officials, will attend 10 public meetings across the country later this year to hear from farmers, ranchers and others with a stake in agriculture. The purpose: to obtain comments and suggestions on the economic and social issues affecting the structure of American agriculture and rural life. The meetings are a part of the "national dialogue on agricultural structure" announced by Secretary Bergland in March. Here's the schedule: Montpelier, Vt., Nov. 27; Fayetteville, N.C., Nov. 28; Huntsville, Ala., Nov. 29; Sioux City, Iowa, Dec. 4; Sedalia, Mo., Dec. 5; Wichita falls, Texas, Dec. 6; Boulder, Colo., Dec. 11; Spokane, Wash., Dec. 12; Fresno, Calif., Dec. 13; and Lafayette, Ind., Dec. 18. For further details--or to submit comments for those who cannot attend any of the meetings--write: Project Coordinator, Structure of Agriculture, USDA, Washington D.C. 20250.

MONTANA BARLEY FOR MALT

A report covering the 1978 crop year showing amounts utilized for malt--by variety, crop reporting districts, and average protein is available by requesting a copy from our office.

NEW REASONS FOR CROP ROTATION....Rising fuel costs and other farm expenses may help make crop rotation popular again according to USDA's Soil Conservation Service. Crop rotation acreage declined some 40 percent in the last decade as cheap plentiful fuel and fertilizers allowed many farmers to switch to planting cash crops year after year. Planting grasses, legumes, or small grains in rotation with row crops can cut nitrogen application, mean fewer tractor runs over the field, and improve soil tilth and water absorption. This could mean lower fertilizer and fuel bills, less fertilizer and pesticide runoff into streams, and--over the longrun--higher crop yields.

1979/80 WORLD GRAIN PROSPECTS DOWN; OILSEEDS UNCHANGED

Region	Total grains			Oilseeds			Cotton		
	1978/79	1979/80 Aug.	1979/80 Sept.	1978/79	1979/80 Aug.	1979/80 Sept.	1978/79	1979/80 Aug.	1979/80 Sept.
	Million metric tons						Million bales		
World	1573.3	1512.9	1505.2	158.6	176.7	176.8	59.7	63.6	64.1
United States	273.1	280.7	285.4	57.6	67.9	69.4	10.9	13.7	14.2
Rest of World	1300.3	1232.2	1219.8	101.0	108.8	107.5	48.8	49.9	49.9

* The world total grain forecast for 1979/80 has been lowered slightly from last month's estimate to 1505 million metric tons. Lower estimates for Soviet wheat and Indian rice crops offset a higher forecast for U.S. coarse grains. World production still is expected to be about 4 percent below record 1978/79 levels, but the second largest harvest on record.

  * The 1979/80 world wheat crop forecast has been lowered 2 percent from last month's estimate and could be 9 percent smaller than last year. The Soviet forecast has been lowered 5 million tons mainly because of reduced area estimates. Continued unfavorable weather has reduced yield prospects in Canada. The U.S. production forecast is slightly lower than last month's.

  * The September estimate of the 1979/80 world coarse grain crop is slightly above last month's but still about 3 percent below last year's record. The U.S. corn crop forecast has been raised because of continued good weather, while the coarse grain crop in India is suffering from dryness.

  * The world rice forecast has been lowered about 2 percent from last month because of sharply deteriorating conditions in India and dryness in Indonesia. The world crop should be about 3 percent smaller than last year's.

* World production of major oilseeds and copra in 1979/80 is projected at 176.8 million tons, slightly above the August forecast. Gains in the United States, particularly for soybeans, were offset by declines in the rest of the world.

  * Soybean production is projected at a record of around 93 million tons, about 13 million above 1978/79, and 1 million above the August estimate. Larger U.S. production, because of favorable weather, accounts for the increase.

  * The forecast of world sunflowerseed production has been lowered slightly from last month's, but should still be record large. The world rapeseed crop is still projected to be record high: the Canadian rapeseed forecast has been lowered from last month's, but should still be up from last year.

* The 1979/80 world cotton crop is estimated at 64.1 million bales, marginally above month-earlier indications, and 7 percent above last season's production. A higher U.S. production forecast accounts for the increase, with the U.S. harvest expected to be substantially above last year's.

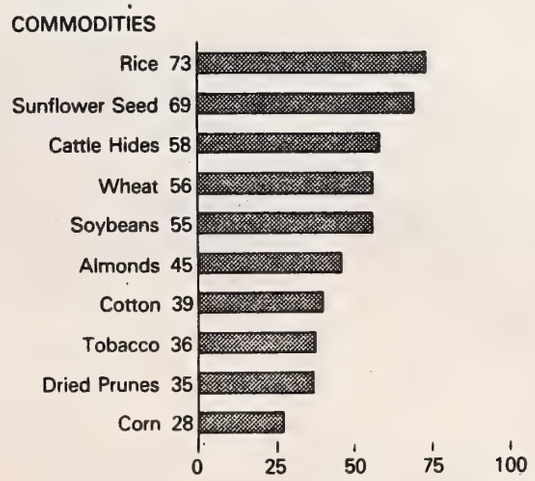
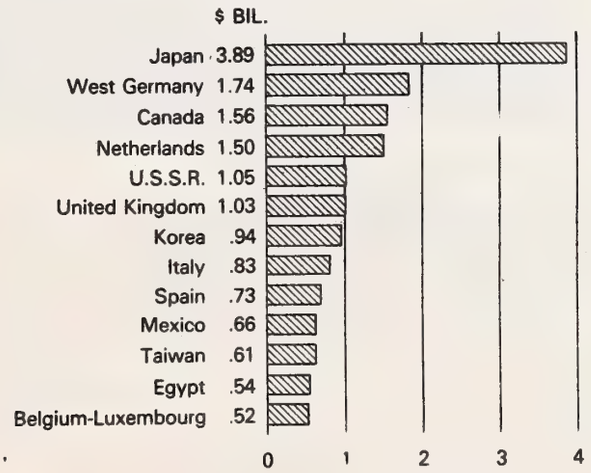
PERCENT OF U.S. FARM PRODUCTION EXPORTED



Year ending September 30 1978 partially estimated Soybeans include bean equivalent of meal and oil

WHERE WE SHIP OUR AGRICULTURAL EXPORTS



1977 data. Adjusted for transshipments through Canada and Western Europe.

FOURTH FORECAST POINTS TO LOWER 1979 USSR GRAIN CROP

Information available through early September suggests a total 1979 USSR grain crop of 180 million tons, 5 million less than the August forecast. Wheat production is estimated at 85 million tons--5 million less than a month earlier, while the estimates of coarse grains and other miscellaneous grains remain unchanged at 85 million and 10 million tons respectively. The September forecast of total grain production mainly reflects a reduction in the estimates of wheat and total grain area.

Grain harvesting is nearing completion throughout the country with some spring grains in the regions east of the Volga Valley and corn in the southern European areas yet to be cut. As of September 3, grains and pulses had been cut on 88.3 million hectares--71 percent of plan. Of the area cut, 74.2 million hectares had been threshed, leaving over 14 million hectares in windrows.

Harvesting in the Ukraine of small grains and pulses was completed near the end of August. At last report, a total of 13.3 million hectares had been cut--far short of the plan goal of over 15 million. This shortfall in harvested grain area in the Ukraine reflects the effect of drought and sukhovey conditions on spring grains.

Harvesting in Kazakhstan has been behind last year's pace due to late maturing grain this season. In addition, some harvesting difficulties have been experienced as is evident from the record area of grain lying in windrows. On September 3, a total of 7 million hectares was in windrows which may have an adverse effect on grain quality should the Soviets not be able to quickly pick up and dry this grain. Frequent press reports have expressed concern in maintaining grain quality.

Both wheat area and total grain area were reduced to reflect preliminary data supplied since the August report by the Soviets under US-USSR Agricultural Agreement. These preliminary grain area data support the earlier estimate of winterkill at about 20 percent. At the same time, the data indicated a lower spring wheat area than expected. The total preliminary grain area was 130.2 million hectares--down from last year's preliminary figure of 131.7 million hectares. The final grain area level last year was 128.5 million hectares compared to the 1979 estimate of 127.5 million hectares.

August 1 livestock and poultry inventory levels in the socialized sector did not reflect any adverse herd liquidation in an attempt to align grain for feed demand with availabilities. Also, both the marketing of hogs and cattle for slaughter in July did not display any unexpected increases in number slaughtered and slaughter weights remained near last year's levels.

The forecast of total USSR grain requirements for 1979/80 remain basically the same compared with a month earlier and the projected volume of grain imports also remains unchanged. The reduction in the crop estimate is reflected in a further drawdown in stocks.

PASTURE AND RANGE

Near-normal temperatures and significant rainfall in many areas of Montana improve range conditions over last month. The September 1 condition averaged 69 percent--up 2 points from August 1 but was 28 points below last year's September 1 condition. Range grass supplies for fall grazing are fair. The September 1 condition was 11 points below the 10-year average.

MONTANA PASTURE & RANGE FEED CONDITION SEPT. 1
by District as a Percent of Normal

DISTRICT	1977	1978	1979
Northwest	62	98	61
Northcentral	54	100	66
Northeast	46	98	68
Central	63	96	68
Southwest	86	87	74
Southcentral	63	93	73
Southeast	53	104	72
STATE	60	97	69

AGRICULTURAL PRICES

Montana farmers received higher prices for durum, other spring wheat, and hay--but lower prices for most livestock items at mid-August compared with a month earlier. The August index of prices received by farmers at 253 (1967=100) was 5 points below last month--but 40 points (19 percent) above a year ago.

(Tables on inside)

NOTABLE NUMBERS

Montana ranchers had an inventory of 2.6 million head of cattle and calves on January 1 this year--the lowest number in 16 years.

MONTANA BARLEY FOR MALT

Domestic maltsters and brewers purchased 6.8 million bushels of Montana's 1978 malting barley crop for use in making malt--a 21 percent increase from 1977.

Approximately 56 percent of all Montana barley acreage was seeded to malting types in 1978. However, only about 12 percent of the entire malting and feed barley production was utilized in producing malt during the year. This indicates substantial portions of the malting barley varieties are used for feed. Piroline, the State's leading planted barley variety is largely used for feed. Conversely, Klages, Moravian, and Karl are mostly used for malting purposes.

(Table on back side)

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 212,000 gallons of ice cream during July--18 percent more than July 1978. Creamed cottage cheese at 472,000 pounds was up 47 percent from last year. Butter production at 105,000 pounds was down 8 percent from last year.

Honey Production

SEPTEMBER 1 CROP REPORT

Montana's 1979 small grain production is forecast at 159.9 million bushels based on conditions as of September 1--a decrease of 25 percent from last year. All wheat is expected to total 114.7 million bushels, 21 percent less than last year. Barley production at 37.8 million bushels is down 33 percent from a year ago and oats production at 7.4 million bushels is down 30 percent.

Winter wheat production at 58.8 million bushels is down 30 percent from a year ago and 7 percent below the August 1 forecast. The September 1 yield per acre forecast dropped 2 bushels from August 1 as harvest revealed lower yields than expected earlier

Spring wheat production at 51 million bushels compares with 53.7 million bushels produced in 1978. The Montana durum wheat crop is forecast at 4.9 million bushels--down from 8.7 million bushels a year ago.

The State's all wheat yield at 22.2 bushels per acre is down 8 bushels from last year and down 1 bushel from last month's forecast. The expected barley yield at 36 bushels per acre compares with 41 bushels in 1978. The expected yield on oats at 37 bushels per acre is 14 bushels below a year ago. Yields for small grains are based on farmers' reports, with nearly all the winter wheat and half the spring grains combined.

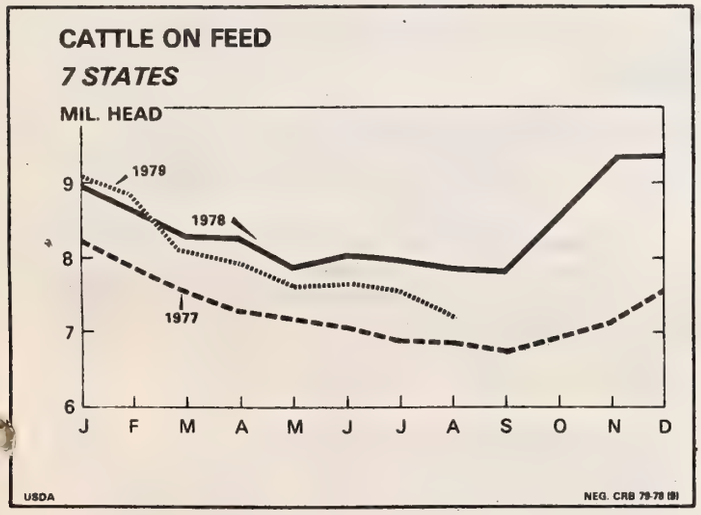
Cattle on Feed

CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed August 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.20 million head, down 8 percent from a year ago but 5 percent more than August 1, 1977. Marketings of fed cattle during July totaled 1.48 million down 8 percent from last year but 2 percent more than July 1977. Placements of cattle and calves on feed in the 7 States during July were 1.22 million, down 22 percent from last year and 18 percent less than July 2 years ago. Net placements of 1.12 million were off 25 percent from last year and 22 percent from 2 years ago. Other disappearance totaled 108 thousand compared with 78 thousand in July 1978 and 55 thousand in 1977.



NOTABLE NUMBERS

Nearly one-third of all U.S. crop production was exported in Fiscal 1978--up from about one-fourth in 1970.

LIVESTOCK SLAUGHTER

Red meat production by Montana slaughter plants totaled 14.2 million pounds during July 1979. This is 18 percent more than July 1978 production and 9 percent more than the June 1979 figure. Production for the first seven months of 1979 at 82.4 million pounds is 1 percent more than for the same period a year ago.

Commercial red meat production for the United States in July 1979 totaled 2.96 billion pounds, up 3 percent from July 1978. January-July red meat production at 21.1 billion pounds was 4 percent below last year. Change by individual components: beef, down 11 percent; veal, down 33; pork, up 12; lamb and mutton, down 5 percent.

FARM LABOR

The total number of workers on Montana farms during the week of July 9-15, 1979 was estimated at 43,000--5 percent more than July 1978. Farm operators plus unpaid family members working 15 hours or more per week were up 19 percent from last year, but hired workers at 11,000 were down considerably from July 1978.

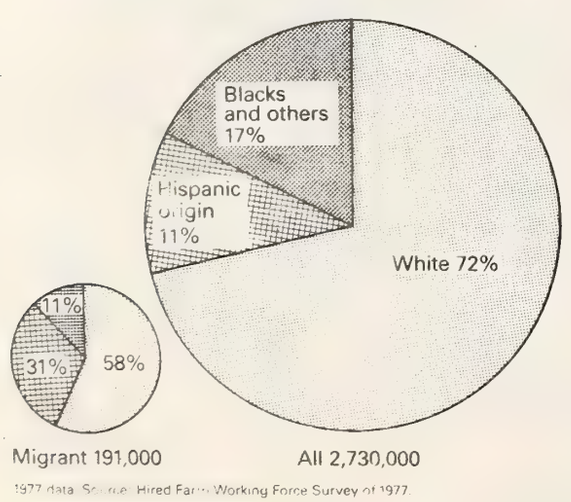
RACIAL/ETHNIC BACKGROUND OF HIRED FARMWORKERS



1977 data. Source: Hired Farm Working Force Survey of 1977.

SUNFLOWERS: UP AND COMING OILSEED

Despite a 75 percent increase in prospective acreage this year, sunflowers are not a contender for the top oilseed spot yet. But soybeans, which are No. 1, will face some stiff competition in the years ahead.

In fact, the time may come when the two will split the market honors--with sunflowers taking over as the premier oil crop and soybeans serving as the protein crop.

Although the sunflower is native to the Americas, sustained production of oilseed varieties began in the U.S. only 13 years ago. Since then, acreage has soared.

Plantings last year totaled over 3 million acres--more than the area planted to such oilseed crops as peanuts or safflowers, or to grains such as rice or rye. The 75 percent increase in acreage planned for this year would push the sunflower total more than 5 million acres.

Leading producers---The big sunflower States currently are North and South Dakota, Minnesota, and Texas. In the northern production area, the acreage gains have come at the expense of flax, wheat, barley, and other small grains.

In the future, the crop may gain ground in other areas too--especially on the fringes of soybean, corn, and cotton areas where yields of these crops are comparatively low.

For the four major sunflower-producing States farmers received an average of 10.7 cents a pound on last year's crop (oil varieties). Based on an average yield of 1,383 pounds per acre, sunflowers earned nearly $148 an acre.

Although soybeans offered a higher U.S. average return per acre, each producer faced a different situation.

Sunflowers compete just as well with soybeans because they have a shorter growing season and usually do better under drought conditions.

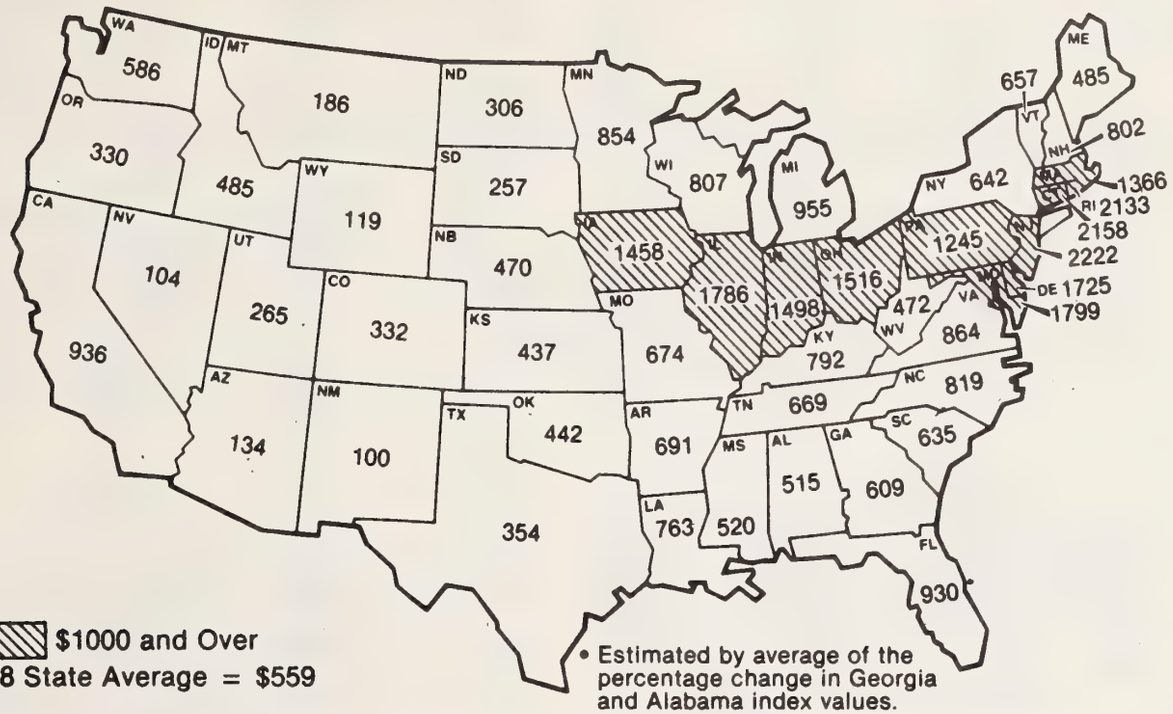
In the South, too, sunflower plantings have caught on rapidly as a result of cutbacks in cotton allotments several years ago.

Sunflowers have served not only as another cash crop for Southern farmers, but have also filled some slack in cottonseed mills left with excess crushing capacity.

CONSUMER PRICE INDEX

The June 1979 Consumer Price Index (U. S. basis) for all urban consumers was 216.6. This is up 1.2 percent from May and 10.9 percent above June a year ago.

Average Dollar Value of Farm Real Estate Per Acre — February 1979



POTATO PRODUCTION AND UTILIZATION HIGHLIGHTS

The nation's 1978 crop of potatoes totaled a record high 365 million cwt. This is 3 percent more than the 1977 crop and 2 percent above the 1976 output--the previous record. The 1978 crop was harvested from 1.37 million acres--up 1 percent from 1977's 1.36 million acres, but down slightly from the 1976 crop acreage. Yields averaged a record 266 cwt. per acre compared with 261 cwt. per acre in 1977 and 260 cwt. per acre for the 1976 season.

Total sales from the record 1978 potato crop accounted for 325 million cwt.--2 percent above 1977, but slightly less than the record sales volume from the 1976 crop. Fresh market sales totaled 30 percent of the 1978 production--down from 33 percent a year earlier. Sales for processing accounted for 48 percent of total production--unchanged from the 1977 crop. Other sales rose to 11 percent of the 1978 crop compared with 8 percent a year ago, due primarily to sales under the USDA diversion program. Use of potatoes on farms where grown and shrinkage and loss accounted for the remaining 11 percent of total production--the same as from the 1977 crop.

Economics, Statistics and Cooperatives Service-USDA and Montana Department of Agriculture • ISSUED TWICE MONTHLY

HIGHLIGHTS IN THIS ISSUE

Agricultural Prices
Dairy Products Manufactured
August 1 Crop Production
Pasture and Range
Wheat Varieties

NOTABLE NUMBERS

In 1977, the world's leading exporter of agricultural products was the United States, with exports valued at 24.8 billion, followed by Netherlands with 10.0 billion, France with 9.3 billion, and Brazil with 7.2 billion.

PASTURE AND RANGE

Hot temperatures and little July rainfall caused Montana pasture and range conditions to decline. The average condition on August 1 was 67 percent compared with 79 last month. Last year on August 1, pastures and ranges were a lush 100 percent. The August 1 conditon was 6 points below the 10-year average.

ONTANA PASTURE & RANGE FEED CONDITION AUGUST 1
by District as a Percent of Normal

DISTRICT	1977	1978	1979
Northwest	61	95	55
Northcentral	53	102	66
Northeast	49	102	73
Central	65	101	68
Southwest	91	88	69
Southcentral	66	99	72
Southeast	61	108	65
STATE	62	100	67

For the nation, pasture and range feed condition on August 1 averaged 84 percent for the 48 contiguous States. This is 7 points above August 1, 1978, 8 points above the 1968-77 average for the date, and is equal to the record high attained in 1967.

Most of the nation reported good to excellent pasture conditions. The major exceptions were the Northeastern States and from North Dakota westward. These areas generally had high temperatures and below normal rainfall during July, which caused pasture and range conditions to decline.

AGRICULTURAL PRICES

The Index of Prices Received by Montana farmers and ranchers at 267 percent of the 1967 base period was up slightly from mid-June to mid-July. Higher crop prices were offset by reduced livestock prices. This index is up 29 percent from a year earlier.

(see inside page for tables)

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 177,000 gallons of ice cream during June--4 percent less than June 1978. Creamed cottage cheese at 432,000 pounds was up 21 percent from last year. Butter production dropped to 111,000 pounds--a 24 percent decline from June 1978.

AUGUST 1 CROP PROSPECTS DOWN

Montana's major grain crops, under stress from heat and drought, suffered reductions in yield prospects during July. However, crop prospects vary between localities, with some farmers reporting winter wheat better than expected, considering the hot weather and reduced rainfall. Based upon current prices and prospects, July weather apparently cost Montana grain producers over $60 million. This year's hot, dry weather has reduced hay yields but helped quality and boosted yields on irrigated corn, dry beans, and sweet cherries.

August 1 yield prospects were based upon reports from a sample of about 500 farmers throughout Montana and 210 wheat objective yield plots.

The 1979 all wheat crop is expected to total 119.7 million bushels--18 percent less than last year and down 12 percent from the July 1 forecast. The State's all wheat acres for harvest is up 7 percent from last year but the overall yield at 23.2 bushels per acre is down from 30.2 last year. Winter wheat production at 63.5 million bushels is down 24 percent, hard spring wheat at 51.0 million is down 5 percent, and durum at 5.2 million is down 40 percent from last year's levels. Hard spring wheat production would have been lower, but acreage was much higher due to reseeding of winter wheat acreage. Compared to a month ago, winter wheat is off 4 percent, hard spring off 20 percent, and durum down 13 percent. Expected average yield per acre on hard spring wheat at 20 bushels per acre is 5 bushels lower than a month earlier.

The State's barley crop at 36.8 million bushels is down 35 percent from a year ago. Oats production at 7.4 million is down 30 percent. Yield per acre prospects for both crops was lowered significantly during July--each down 3 bushels.

Lamb Crop & Wool Production
Quarterly Milk Production
New Cropland
Slaughter

NOTABLE NUMBERS

In 1978, Montana ranchers marketed 1,571,000 head of cattle---of this total, only 171,000 (11 percent) were slaughtered in Montana. Thus, about 1,400,000 head of cattle were shipped out of Montana last year.

MONTANA CATTLE HERD REBUILDING

Montana cattlemen have started to expand their herds after a 5-year decline. The total of all cattle and calves on the State's farms and ranches on July 1, 1979 at 3.75 million head was 3 percent more than a year earlier but still 14 percent under the peak number for this date in 1974. This increase is a turnaround from the January 1, 1979 Montana all cattle inventory decline. The July 1 beef cow inventory at 1.55 million was up 3 percent and beef replacement heifers at 307 thousand were up 24 percent. Other heifers weighing over 500 pounds (not for replacement) were down 23 percent.

NATIONAL CATTLE HERD CONTINUES DOWN

The national cattle inventory is estimated at 118 million head on July 1 this year--down 3 percent from a year earlier. This is the fourth consecutive year of herd reduction for July 1 estimates in the current cattle cycle. All classes are down except herd replacement heifers.

Cows at 47.7 million head are down 2 percent; but beef replacement heifers are up 8 percent and milk cow replacement heifers are up 4 percent. Steers are down 6 percent and calves on hand July 1 are down 3 percent.

The 1979 calf crop is expected to be 43.5 million head--1 percent less than 1978. This would be the lowest calf crop since 1963.

FARMLAND VALUE UP 14 PERCENT LAST YEAR

Farmland prices increased an average of 14 percent for the year ending February 1, 1979--up from 9 percent the year before but near the average annual rate since 1972. Combining this with a slight increase in farm size, the average value per operating unit increased 16 percent to $251,000.

In a summary of the Farm Real Estate Market Developments report released today by the Economics, Statistics, and Cooperatives Service, USDA economists indicated that through February 1, 1980, the value of farmland is likely to rise at about last year's rate of 14 percent. This forecast in part reflects further improvement in farm income and a higher general inflation rate.

The total value of farm real estate was $584 billion on February 1--up $72 billion from last year. Building values accounted for $98 billion or 17 percent of the total value. The national average value per acre was $559, with State averages ranging from $100 an acre in New Mexico to $2,222 in New Jersey.

Major increases in land value during the survey year were not confined to any particular region. States scoring the sharpest gains--20 percent or more--included Nebraska, Arkansas, Colorado, Ohio, and California.

The rate of farm transfers dropped 5 percent to 39.6 tracts per 1,000 farms. Combining this with 2 percent fewer farms, the total number of transfers declined 7 percent--from 91,800 to 85,600. In light of the rising level of farm income, the rate of transfers could increase in the current year. Farm enlargement accounted for 63 percent of all farmland purchases in the last survey year compared with 58 percent the year before.

With interest rates increasing prior to March of this year, longterm lenders were quite willing to provide real estate financing. A record high 90 percent of all transfers last year were credit financed. Sellers and Federal land banks supplied 67 percent of this credit financing. Life insurance companies dropped their market share this year by financing only 10 percent of new loan funds compared with 15 percent last year.

Transfers of farmland expected to remain in agricultural use 5 years after the date of purchase accounted for 84 percent of all purchases, 93 percent of the total acres, and 91 percent of the total value transferred. Expected use as a rural residence was the most common form of competition, accounting for 8 percent of the purchases. For most uses, the average price per acre for tracts under 100 acres typically was nearly twice as high as the overall average price.

Cash rents generally continued upward, but the rate of increase slowed. Because land values continued to climb at a faster rate, the ratio of gross cash rents to land prices dropped.

CATTLE ON FEED DOWN

Montana feedlots held 8 percent fewer cattle and calves on July 1 compared with the same date last year. The July 1 survey of feedlots shows 48,000 on feed for the slaughter market--the lowest figure on this date since 1964. Steers numbering 23,000 were up 5 percent but heifers at 24,000 were down 17 percent from a year earlier. About 48 percent of all steers and heifers on feed weighed 900 pounds or more compared with 35 percent last July 1. An estimated 15,000 were marketed from feedlots during the April-June quarter--25 percent less than last year. Placements the past 3 months at 15,000 were unchanged from a year ago. Montana feeders expect to market 36,000 during the July-September quarter--down 5 percent from the same period last year.

Expected total marketings (1979) including an allowance for those placed on feed after July 1 and marketed before September 30.

CONSUMER PRICE INDEX

The May 1979 Consumer Price Index (U.S. basis) for all urban consumers was 214.1. This is up 1.2 percent from April and 10.8 percent above May a year earlier.

LAMB CROP And WOOL

Montana's lamb crop is estimated at 340,000 head--down 3 percent from 1978. Lambs saved per 100 ewes one year old and older on hand January 1 is 105--7 more than last year.

Wool production in Montana is placed at 4.0 million pounds--down 4 percent from last year. The total number of sheep shorn at 412,000 head was down 1 percent from 1978.

LAMB CROP And WOOL

MILK PRODUCTION DOWN

Montana milk production in the second quarter (April-June) increased seasonally over the first quarter but failed to reach last year's level. Dairymen produced 78 million pounds of milk in the 3 months--April through June 1979--2 percent less than the same quarter last year. Average grain fed to all cows in the herd was 11.5 pounds per day--down 1.0 from last July.

LIVESTOCK SLAUGHTER

Red meat production by Montana slaughter plants totaled 12.9 million pounds during June 1979--11 percent more than 1978 June production and 10 percent more than the 1979 May figure. Production for the first six months of 1979 at 68.2 million pounds is 2 percent less than the production for the first half of 1978. The June 1979 cattle kill was 11,500 head compared with 11,800 head in June 1978. The hog kill at 36,600 head was up 26 percent from last year.

Commercial red meat production for the United States in June 1979 totaled 2.99 billion pounds--down 3 percent from June 1978. January-June red meat production at 18.1 billion pounds was 5 percent below last year. Change by individual components: beef, down 12 percent; veal, down 35; pork, up 10; lamb and mutton, down 5 percent.

LAND BROKEN UP FOR CROPPING

Our definition of "New Cropland" is land broken up for cropping which was previously native sod, improved pasture and the other land not tilled in the past 3 years. The Montana Crop and Livestock Reporting Service has been collecting data on new lands broken up for the past 5 years. New land broken up in Montana for cropping totaled 150,000 acres during the July 1, 1978 to June 30, 1979 period. Of this amount, 145,000 acres were actually cropped. These amounts are significantly less than the acreages broken up during each of the previous 4 years and reflect the effect of the Federal farm program which restricts planting of wheat and barley. The 5-year total is slightly more than 1.15 million acres--or about 231,000 each year.

The second table shows the total of planted acreage estimates for 1975-79 and the change in acreage each year. The results from these two approaches do not agree exactly and probably shouldn't since summerfallow practices can change and some crop land may be withdrawn and put into permanent pasture, new hay seedings or other uses.

PASTURE And RANGE CONDITION

Montana range and pasture condition declined in June because of topsoil moisture shortages. However, conditions were variable with mid-June rains in some sections, stimulating grass development.

The reported condition as of July 1 was 79 percent--4 points below June 1. In the past 15 years, the condition has fallen from June 1 to July 1 only 3 times--the usual movement is up 5 to 6 points. Compared with July 1 last year, the present condition is down 29 points.

MONTANA PASTURE & RANGE FEED CONDITION JULY 1
by District as a Percent of Normal

DISTRICT	1977	1978	1979
Northwest	69	98	74
Northcentral	55	98	78
Northeast	55	105	80
Central	67	98	79
Southwest	91	88	86
Southcentral	69	99	81
Southeast	63	109	74
STATE	66	100	79

For the nation, all States except North Dakota and those in the northwest and southeast recorded good to excellent conditions. Conditions improved from a month ago in 12 States and from a year ago in 18 States. Most of the improvement during the month occurred in the Plains States where excellent growing conditions existed following cool spring weather.

AGRICULTURAL PRICES

Montana farmers received higher prices for wheat on June 15 compared with mid-May, but mostly lower prices for feed grains, hay, and livestock. The index of prices received by farmers for mid-June at 272 (1967=100) was 1 point below mid-May but 61 points (30 percent) above a year ago. The all crops index at 234 points was 31 points above last month and 35 points above June 1978. The livestock index at 302 points was down 24 points from mid-May, but up 85 points from June 1978.

Nationally, the June Index of Prices Received by Farmers decreased 3 points (1 percent) to 243 percent of its January-December 1967 average. Contributing most to the decrease since May were lower prices for cattle, hogs, broilers, calves, and hay. Higher prices for wheat, corn, soybeans, and oranges were partially offsetting. The index was 26 points (12 percent) above June 1978.

(Tables Inside Page)

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 162,000 gallons of ice cream during May--10 percent more than May 1978. Creamed cottage cheese at 454,000 pounds was up 31 percent from last year. Butter production dropped to 147,000 pounds--a 10 percent decline from last year.

GRAIN CROPS REDUCED

Production of spring wheat other than durum will be up considerably but output of most other 1979 Montana crops is expected to be below last year's levels. Grain crops progressed rapidly despite a slow start, but most were only in fair condition on July 1 and showing stress due to lack of moisture.

The 1979 all wheat crop is expected to total 135.5 million bushels--7 percent less than last year's total output of 146.1 million bushels. Winter wheat is expected to yield 28.0 bushels per acre--which would place production at 65.8 million bushels--down 21 percent from 1978 (unchanged from June). The decrease in production is mainly the result of a reduced acreage due to heavy winterkill. Durum at 6.0 million bushels is down 31 percent as a result of decreases in both yield and acreage. Production of other spring wheat at 63.8 million bushels is up 19 percent from 1978. The increase is a result of a larger acreage due to extensive reseeding of winter wheat.

The State's barley crop at 39.9 million bushels is down 29 percent and oats production at 8.0 million bushels is down 25 percent. The lower production for both crops is a result of decreases in both yield and acreage.

Sweet cherry production is forecast at 2,300 tons compared with 1,850 tons last year. Pollination conditions were ideal and the June drop was about normal.

Global Wheat Production Down

World wheat production will range from 385 to 420 million tons, down from 438 million in 1978/79. Among the major developments other than weather affecting the production and trade outlook in 1979/80 are:

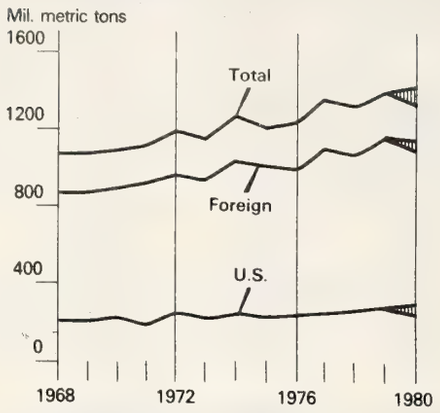
- Transportation bottlenecks faced by our major competitors, which may limit exports to only about 30 million tons, despite potential availabilities of 40 to 45 million tons.
- Larger import requirements, due to bad weather in Europe and the winter wheat areas of the Soviet Union and continued population and economic growth which increase import requirements in the developing countries 5 to 10 percent a year, coupled with a little growth in agricultural production in the poorer developing countries.
- Sizable import requirements by China, despite improved production prospects.
- Foreign exchange shortages, for some countries which will be more of a problem in 1979/80 because of prospects for lower export earnings and higher costs of imports.

Coarse Grain Demand Strengthens

World coarse grain production in 1979/80 will range from a low of 687 million tons with generally unfavorable weather to a high of 731 million with favorable weather. Among the major factors influencing world trade prospects are:

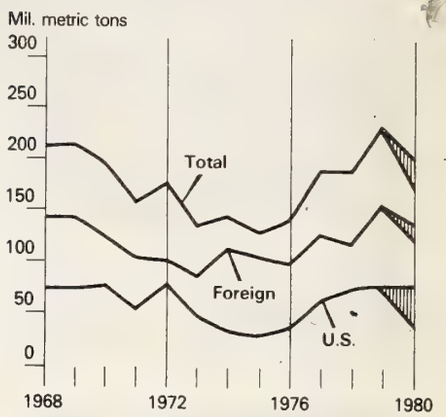
- Carryin stocks are estimated at 97 million tons, 14 percent above a year earlier.
- Import requirements are expected to be up sharply in the Soviet Union and Eastern Europe.
- Growth in livestock production in major foreign markets is likely to be only around 2 percent in 1979/80.
- Production and use of cereal substitutes likely will decline during 1979/80.

World Grain Production



Includes wheat, coarse grains, and milled rice.

World Grain Stocks



Includes wheat, coarse grains, and milled rice.

World Grain Consumption

MONTANA WHEAT STOCKS DOWN

Wheat stored on Montana farms and in mills and elevators on June 1, 1979 totaled 86.4 million bushels, 12 percent less than the same date a year ago. This is old-crop wheat to be carried over to the 1979 marketing year. Disappearance since April 1 reached 35.3 million bushels. Farm storage held 71.6 million bushels, 15 percent less than a year ago, while off-farm storage held 14.8 million--up 5 percent. Winter wheat in all positions totaled 49.0 million bushels--10 percent below last year. Spring wheat stocks including durum were 37.4 million bushels--14 percent below last year. Durum in storage totaled 7.0 million, 10 percent more than last year. Barley stocks in all positions were 25.8 million bushels--up 63 percent from last year and oats stocks at 6.2 million were up 102 percent.

Nationally, old crop all wheat stored in all positions on June 1, 1979 totaled 922 million bushels--22 percent less than last year's 1.18 billion bushels. Farm stocks amounted to 484 million bushels and off-farm stocks were over 437 million bushels. By comparison, last year's June 1 on-farm stocks were 493 million bushels and off-farm stocks were 684 million bushels. April-May disappearance this year was 303 million bushels compared with 351 million bushels last year.

EGG PRODUCTION

Layers in Montana produced 47 million eggs in the period March 1 through May 31. This is down one million from the same period last year. The number of layers on hand as of June 1 was 745 thousand--down 6 percent from last year. Rate of lay also showed a decrease from 67 percent to 63 percent.

Nationally, 17.4 billion eggs were produced in the March-May quarter. This is a 2 percent increase over last year. Layers on hand June 1 were up 1 percent at 279.9 thousand. The rate of lay per 100 birds was up slightly from 66.5 last year to the June 1 figure of 66.7

HOGS AND PIGS UP

Hogs and pigs on farms in the U.S. June 1, 1979 were 18 percent above last year--19 percent larger than 1977 and the largest June inventory since 1971. According to the latest USDA survey of farmers and ranchers, the hog and pig inventory totaled 64.9 million head. Breeding inventory at 10.4 million was 17 percent higher than a year ago and 19 percent above 2 years earlier. Market hog inventory at 54.5 million head was 18 percent larger than 1978 and 19 percent greater than 1977.

Spring farrowings December 1978-May 1979 were 19 percent above last year. Pigs saved per litter at 7.05 were about the same as last year's low level and the resulting pig crop moved up 19 percent from a year ago.

U. S. hog producers intend to farrow 7.42 million sows in the fall period June-November, up 16 percent from that same time period last year.

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 3 percent more red meat during May 1979 than during the same month a year ago. Total production for May at 11.8 million pounds compares with 11.5 million pounds produced last May and 10.3 million pounds produced during April 1979. The January-May 1979 production of 55.3 million pounds is 5 percent less than the same period a year ago. The May 1979 cattle kill was 11,000 head compared with 11,200 head last year. The hog kill at 34,000 head was up 13 percent from a year earlier.

Commercial red meat production for the United States in May 1979 totaled 3.13 billion pounds--down 4 percent from May 1978. The May 1979 production is 9 percent above last month. January-May 1979 red meat production at 15.1 billion pounds was 5 percent below last year... change by individual components: beef, down 12 percent; veal, down 35; pork, up 9; lamb and mutton, down 3 percent.

STORED SEED SURVIVE

Grass and clover seeds can be stored at sub-freezing temperatures for long periods of time and still produce as much forage when planted as fresh seed, a SEA researcher has proven. For years, researchers have been storing seeds to assure future generations of forage resources without any real knowledge as to whether or not the seed would perform following prolonged periods of storage. Clarence M. Rincker, SEA agronomist at Prosser, Washington, has demonstrated that forage seed can be frozen, thawed, refrozen, and rethawed over long periods of time without a loss of productive ability providing the stored seed was of high quality to begin with.

Cattle on Feed
Cherry Production
Pasture and Range
Winter Wheat Production
Dairy Products Manufactured

CHERRY PRODUCTION UP

This year's cherry crop in Montana is forecast at 2,200 tons--up 19 percent from last year. Pollination conditions were ideal but effects of last winter's harsh temperatures to trees have not been fully assessed.

In the six western States, production is forecast at 147 thousand tons--up 27 percent from last year.

MONTANA WINTER WHEAT PRODUCTION DOWN

Prospects for the 1979 Montana winter wheat crop continue to decline and production is forecast at 65.8 million bushels as of June 1--down 21 percent from last year and down 15 percent from last month's forecast. Grower reports indicate that along with substantial loss of acreage to winterkill, many remaining stands are thin and spotty and will yield less than normal. Subsoil moisture remains adequate--but windy, dry conditions caused surface moisture to become short. Cool weather has also slowed development.

Nationally, production of winter wheat is forecast at 1.43 billion bushels based on June 1 conditions. This is 14 percent greater than last year's crop of 1.25 billion bushels and 3 percent above last month's forecast. A larger acreage for harvest this year plus prospects for a higher yield results in the higher production forecast. Farmers expect to harvest 42.9 million acres for grain--10 percent more than last year.

Growers expect a yield of 33.3 bushels per harvested acre this year compared with 32.1 bushels last year and last month's forecast of 32.4 bushels. Generally cool temperatures plus adequate moisture contributed to the increased yield prospects in most of the wheat growing area.

Winter wheat rated fair to mostly good during early May, with development in the heading stage as far north as southern Kansas. By end of month, the crop rated good in most areas. Wheat maturity advanced to the heading stage as far north as Nebraska by June 1 but generally is lagging behind last year. Harvesting in southern areas has been slowed by rains, with Texas progress less than 5 percent complete.

PASTURE AND RANGE FEED CONDITION

Montana pastures and ranges developed slowly in early May with mostly cool days and cold nights. After mid-May temperatures moved up but topsoil moisture became short in some areas of the State as rain came only in the form of widely scattered showers. Early grass made very limited growth.

MONTANA PASTURE & RANGE FEED CONDITION JUNE 1
by District as a Percent of Normal

DISTRICT	1977	1978	1979
Northwest	76	97	85
Northcentral	60	97	87

NEG. ESCS 100-79(6)

CATTLE ON FEED DOWN

Cattle and calves on feed June 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.70 million head--down 4 percent from a year ago but 9 percent more than June 1, 1977. Marketings of fed cattle during May totaled 1.60 million--down 4 percent from last year but 8 percent more than May 1977. Placements of cattle and calves on feed in the 7 States during May were 1.85 million--9 percent less than last year but 16 percent larger than May 1977. Net placements of 1.63 million were off 11 percent from last year but up 22 percent from 2 years ago. Other disappearance totaled 218 thousand head compared with 205 thousand in May 1978 and 254 thousand in 1977.

ALFALFA SEED PRODUCTION DOWN

Montana alfalfa seed produced in 1978 totaled 2.2 million pounds--down 37 percent from 1977. Harvested acreage at 26,000 was down 33 percent and yield at 85 pounds per acre was off 5 pounds from the previous year. The value of the State's production at $2.2 million was 40 percent less than the 1977 value. Price per pound of seed at $1.00 in 1978 compares with $1.05 for 1977.

The U.S. production of alfalfa seed in 1978 is estimated at 92.5 million pounds--down 5 percent from last year. Most of the decline occurred in California--the major producing State. Heavy rains at harvest time reduced California's yield to less than half of the previous year. The U.S. farm value of alfalfa seed production is estimated at $107 million compared with $103 million in 1977. Average price per cwt. was $117.00--an increase of $9.00 from last year.

AGRICULTURAL PRICES

Montana farmers received higher prices for wheat on May 15 compared with mid-April but mostly lower prices for feed grains, hay, and livestock. The index of prices received by farmers for mid-May at 276 (1967=100) was only 1 point above mid-April but 63 points (30 percent) above a year ago. The all crops index at 211 was 9 points above last month but the all livestock and products index at 325 was 4 points below the previous month. However, the livestock index was 101 points (45 percent) above a year ago, while the crops index was up only 11 points (6 percent). The only items in the index showing an increase during the month were wheat, beef cows, and wool. All other items decreased, with barley, oats and eggs, showing the sharpest declines.

Nationally, the May index of prices received by farmers increased 2 points (3/4 percent) to 246 percent of its January-December 1967 average. Contributing most to the increase since April were higher prices for hay, wheat, citrus, corn, potatoes, and broilers. Lower prices for cattle, tomatoes, eggs, hogs, and soybeans, were partially offsetting. The index was 31 points (14 percent) above a year ago.

The index of prices paid by the nation's farmers for commodities and services, interest, taxes and farm wage rates for May 15 was 247--up 1 point (1/2 percent) from mid-April. Lower prices for feeder livestock were more than offset by higher prices for feed, fuels and energy, autos and trucks, and family living items. The May index was 28 points (13 percent) above a year ago.

CASH RENTAL RATES UP FROM LAST YEAR

As of March 1, 1979, average cash rents for agricultural land were up from a year earlier, reflecting 1979's increase in net farm income and optimism about income this year.

According to USDA's Economics, Statistics, and Cooperatives Service, the average rate per head per month for pasturing cattle in the nine Western States rose 9 percent. Pasture cash rents per acre generally showed the largest percentage increases, followed by whole farms and cropland.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 143,000 gallons of ice cream during April, 1 percent more than April 1978. Creamed cottage cheese at 411,000 pounds was up 37 percent from last year. Butter production dropped to 142,000 pounds--a 10 percent decline from last year.

NEW LOOK

We are pleased to present the "Montana Crop and Livestock Reporter" in this new larger format. The new larger size was made possible by an improvement in our offset press which allows us to print on the larger size paper.

The format will not be greatly different, but should make the reporter more readable and allow additional use of charts and graphs as space and need make them appropriate. Much of the report will continue to be narrative, with tables containing basic crop, livestock and price information for Montana and the United States. Space is still limited, so some available detail may be omitted, as well as data for other States--but this will be provided upon request.

We do, however, want to present the information in a way to make it most useful to you. If you have suggestions for improving the usefulness of the reports, please give us the benefit of your ideas.

Daniel L. Herbert,
State Statistician

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 3 percent more red meat during April 1979 than during the same month a year ago. Total production for April at 10.3 million pounds compares with 10.0 million pounds produced last April and 11.1 million pounds produced during March 1979. The January-April 1979 red meat production at 43.5 million pounds is 7 percent less than the same period a year ago.

Commercial red meat production for the United States in April 1979 totaled 2.88 billion pounds--down 6 percent from April 1978. January-April red meat production at 12.0 billion pounds was 5 percent below last year....change by individual components: beef, down 11 percent; veal, down 35; pork, up 7; lamb and mutton, down 3 percent.

CONSUMER PRICE INDEX

The April CPI for all urban consumers, 1967 base, was 211.5. This was up 1.1 percent (2.4 points) from March and up 10.4 percent (20 points) from April 1978.

WINTER WHEAT FORECASTS: A GLANCE AT THE TRACK RECORD

"Crop estimates are always too high. The estimates are never right".

Farmers sometimes direct these remarks at the accuracy of estimates prepared by the Montana Crop and Livestock Reporting Service and the Crop Reporting Board. How valid are these statements?

The accompanying tables for Montana and the U. S. illustrate how the forecasts for winter wheat from 1972 to 1978 reflected changing prospects during the growing seasons. Changes in the forecasts from one month to the next result from changes in growing conditions caused by factors that normally can't be anticipated--such as insect damage, disease and drought, which lower prospects or badly needed rains that sharply improve the outlook.

The tables depict just how close the forecasts during the growing season were to the eventual crop size. The widest variance generally occurs early in the season and narrows toward harvest as the crop gets more fully developed and reveals more about its yield potential.

FARM LABOR

The total number of workers on Montana farms during the week of April 8-14, 1979 was estimated at 34,000--about the same as April 1978. Farm operators plus unpaid family members working 15 hours or more per week were down 15 percent from last year, while hired workers at 11,000 were up considerably from April 1978.

ACTUAL WHEAT COUNTS TO BE TAKEN

Wheat production forecasts are watched throughout the summer with great interest. Several pieces of information are used to arrive at a Montana and a U.S. production estimate each month during the growing season. In addition to individual farmer reports, an objective yield survey is done each month. In Montana, about 400 randomly-selected plots of winter wheat, spring wheat and durum are located on farms with the permission of farmers. These plots are visited each month by trained enumerators who count stalks and heads and make clippings. The clippings are sent to a lab where kernel counts and weights are taken. From all plots the information is combined and expanded to make an estimate of potential yield for the State, region, and U. S. Just before harvest, a portion of each plot is harvested with appropriate counts and weights made. These data provide an indication of harvest yield. After the field is harvested, counts of harvest loss are made to determine a final net yield.

Seventeen other States participate in similar wheat objective yield surveys. By combining producer reports and objective yield data, more reliable production forecasts can be made. In addition to wheat objective yield, other States have objective yield for corn, cotton and soybeans.

HOGS AND PIGS

Inventory of hogs and pigs on March 1, 1979 in the 14 States conducting quarterly hog surveys was estimated at 50.5 million head--up 13 percent from a year earlier. This is the largest March 1 inventory since 1971. The number kept for breeding at 8.34 million was up 20 percent from 1978 and 19 percent above 1977. The number for market at 42.2 million was 12 percent above 1978 and 14 percent more than 1977. Survey results indicate producers incurred death losses during the December-February quarter about 25 percent greater than last year. This was due to disease and severe winter weather--especially in the Western Corn Belt States.

The 14 quarterly States account for about 85 percent of the U.S. hog and pig inventory.

The December 1978-February 1979 pig crop in the 14 States totaled 18.3 million--17 percent more than both 1977 and 1978. There were 2.66 million sows farrowed in these States--up 16 percent from the previous year and 15 percent more than two years ago.

Producers in the 14 quarterly States intend to have 3.55 million sows farrow in the March-May 1979 period--24 percent more than last year and 23 percent above 1977. Farrowing intentions reported for the June-August 1979 period are 3.16 million sows--19 percent above 1978 and 22 percent more than 1977.

WINTER WHEAT PRODUCTION

Loss of winter wheat acreage to winter kill in Montana has reduced 1979 production prospects. Production is forecast at 78 million bushels as of May 1 based on producer reports of winter kill and crop condition. This is down 7 percent from last year and 22 percent below the December 1 forecast. Although yields per acre are expected to remain near the December 1 estimate level, acreage expected for harvest is off sharply. Soil moisture has been adequate this spring but cool weather has retarded growth. Winter kill has varied from light to heavy in major growing areas, with the heaviest loss in the important "Triangle" area. Much of the winter kill acreage will probably be reseeded to spring grains--later surveys will determine replanted acres. In only two previous years--1950 and 1956--has Montana shown similar high abandonment due to winter kill. In 1950, 19 percent of the acreage was not harvested and in 1956, 35 percent was lost--most because of winter damage.

WINTER WHEAT

SELECTED STATES	AREA HARVESTED		PRODUCTION	
	1978	Ind. 1979	1978	Ind. 1979
	----------1,000 Acres----------

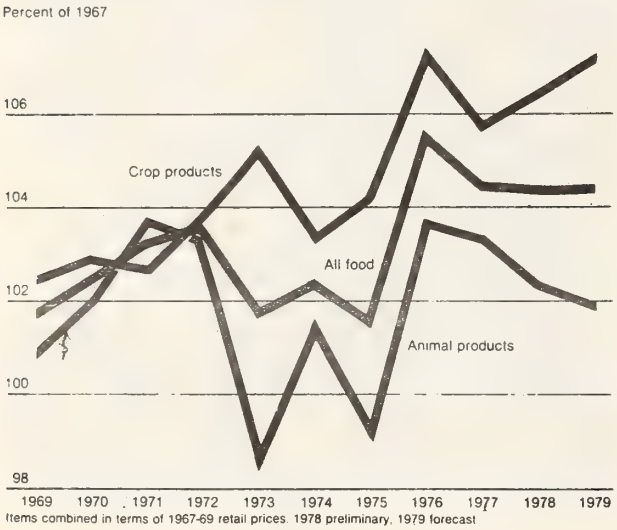
HAY STOCKS

Despite the long feeding season, hay stocks on Montana farms are up sharply from last year. May 1 stocks are estimated at 869,000 tons--71 percent over last year. The higher stocks are the result of a very good hay crop in 1978 and last May's low stocks level. The United States hay stocks on farms May 1 totaled a record high 29.9 million tons--24 percent above last year and 53 percent above 1977.

PER CAPITA FOOD CONSUMPTION TRENDS

Significant changes took place in food consumption during the last 10 years. While annual total food consumption remained relatively stable at 1,440 pounds per person, preferences for individual food commodities changed.

Per Capita Food Consumption



Items combined in terms of 1967-69 retail prices. 1978 preliminary, 1979 forecast

CATTLE ON FEED

Cattle and calves on feed May 1 for slaughter market in the 7 States preparing monthly estimates totaled 7 67 million head, down 2 percent from a year ago but 7 percent more than May 1, 1977. Marketings of fed cattle during April totaled 1.54 million--down 10 percent from last year and 1 percent less than April 1977. Placements of cattle and calves on feed in the 7 States during April were 1.48 million--4 percent lower than last year and 10 percent below April 1977. Net placements of 1.26 million were down 3 percent from last year and off 15 percent from 2 years ago. Other disappearance totaled 220 thousand head compared with 235 thousand in April 1978 and 178 thousand in 1977.

MANUFACTURED DAIRY PRODUCTS

March ice cream production in Montana at 166,000 gallons was up 3 percent from last year. Butter production at 158,000 pounds was down 8 percent. Production of creamed cottage cheese showed the largest gain. Montana dairy plants produced 419,000 pounds of cottage cheese--a 25 percent increase from a year earlier.

AGRICULTURAL PRICES

Hog prices dropped substantially but Montana farmers and ranchers received higher prices for most other livestock on April 15 compared with a month earlier. The All Farm Products Index at mid-April was 273 (1967=100)--up 2 percent from mid-March and 31 percent above a year ago. Hog prices registered a drop of 11 percent but cattle prices continued to make gains during the month, with steer and heifer prices up 5 percent and cow prices up 2 percent. Spring wheat and durum were the only crops showing an increase during the month, while prices of most other crop items declined from the previous month.

Nationally, the April Index of Prices Received by farmers decreased 2 points (1 percent) to 244 percent of its January-December 1967 average. Contributing most to the decrease since March were lower prices for hogs, oranges, eggs, lettuce, and milk. Higher prices for cattle, tomatoes, and calves were partially offsetting. The index was 36 points (17 percent) above a year ago.

The Index of Prices Paid by the nation's farmers for commodities and services, interest, taxes and farm wage rates for April 15 was 245--up 2 points (3/4 percent) from mid-March. Higher prices for feeder livestock, fuels and energy, seed, building and fencing materials, feed and family living items accounted for most of the increase. The April index was 29 points (13 percent) above a year ago.

PASTURE AND RANGE FEED CONDITION

Montana pastures and ranges started slow because of wet, cold weather in April. Soil moisture in most areas is good, but growth has been limited by cold temperatures. Cattle have been picking some old grass on low elevation ranges but new grass is not providing much feed.

MONTANA PASTURE & RANGE FEED CONDITION MAY 1
by District as a Percent of Normal

DISTRICT	1977	1978	1979
Northwest	76	85	87
Northcentral	61	81	83

APRIL PROSPECTIVE PLANTINGS

Montana farmers intend to plant more other spring wheat but fewer acres of most other spring planted crops. Total acreage seeded to all spring crops (excluding hay) is expected to be down 5 percent from a year ago. Montana 1979 all wheat acreage including winter wheat seeded last fall is now expected to be 5,290,000 acres--up 4 percent from last year. Growers seeded 3,000,000 acres of winter wheat last fall--3 percent more than a year earlier.

Acreages actually planted may vary from those indicated as a result of weather, economic conditions, availability of production inputs, and the effects of this report itself on farmers' intentions.

CATTLE ON FEED

Cattle and calves on feed for the slaughter market in Montana feedlots April 1, 1979 totaled 58,000 head--27 percent less than January and 3 percent less than April last year. An estimated 21,000 head were marketed from feedlots from January 1 through March 31--51 percent less than the same quarter in 1978. Placements in lots during the January-March period totaled 14,000 head--61 percent less than last year. Montana feeders expect to market 28,000 head during the April-June period--40 percent more than the same period last year.

Expected total marketings (1979) including an allowance for those placed on feed after April 1 amd marketed before June 30.

1978 MEAT ANIMAL RECEIPTS UP

Higher marketings and increased prices for Montana's livestock in 1978 brought meat animal cash receipts to a record-high 628.3 million dollars--41 percent above the previous year. Cattle and calves contributed 92.2 percent of the total cash receipts in 1978, while hogs represented 5.4 percent and sheep and lambs 2.4 percent of the total.

POULTRY INCOME UP IN 1978

Montana egg producers grossed 3 percent more income from eggs during 1978 compared with 1977 due to higher egg production. Gross income from eggs accounts for 98 percent of the State's poultry income. The average price received for eggs during 1978 at 54.3 cents per dozen was 2.7 cents below 1977. Eggs sold rose to 185 million from 171 million the previous year. Poultrymen sold 6 percent more pounds of chicken in 1978 than in 1977. The average price per pound at 7.0 cents was 1.0 cent less than the previous year. Gross income from chickens at 198,000 dollars was 9 percent below 1977.

APRIL 1 GRAIN STOCKS

Wheat stored on Montana farms and in mills and elevators on April 1, 1979 totaled 121.1 million bushels--2 percent above the same date a year ago. Disappearance since January 1, reached 36.1 million bushels. Farm storage held 102.2 million bushels--about the same as a year ago, while off-farm storage held 18.9 million--up 15 percent. Winter wheat in all positions totaled 64.9 million bushels--6 percent below last year. Spring wheat stocks including durum were 56.3 million bushels--14 percent above last year. Durum in storage totaled 9.0 million--up 31 percent from April 1978. Barley stocks in all positions were 33.0 million bushels--up 27 percent from last year, and oats stocks at 7.6 million were up 76 percent.

Nationally, all wheat stocks in all positions on April 1, 1979 totaled 1.22 billion bushels--20 percent less than last year's April 1 stocks of 1.53 billion bushels. About 51 percent of the stocks or 629 million bushels were on-farm, while 595 million bushels were in off-farm facilities. Barley stocks in all positions on April 1, 1979 totaled 295 million bushels--24 percent above last year.

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 3 percent less red meat during March of 1979 than during the same month a year ago. Total production for March at 11.1 million pounds compares with 11.4 million pounds last March and 9.8 million pounds during February 1979. The January-March 1979 total red meat production at 33.1 million pounds is 9 percent less than the same period a year ago.

Commercial red meat production for the United States in March 1979 totaled 3.09 billion pounds--down 7 percent from March 1978. January-March red meat production at 9.13 billion pounds was 5 percent below last year---change by individual components: beef, down 9 percent; veal, down 35; pork, up 5; lamb and mutton, down 4 percent.

MILK PRODUCTION

Montana dairymen produced 67 million pounds of milk in the 3 months, January through March 1979. Production was 4 percent below the same quarter last year--mainly because of unusually cold weather in January and February. Milk production fell in spite of a 1,000 cow expansion in the herd from 27,000 in 1978 to 28,000 as of April 1, 1979. Milk from each cow in the herd averaged almost 27 pounds per day compared with nearly 29 pounds the previous year. Average grain fed to all cows in the herd was 12.5 pounds per day, down .5 from last April.

U. S. milk production, Jan.-March, totaled 30.0 billion pounds, 1 percent above the same period last year.

PASTURE AND RANGE FEED CONDITION

Montana pastures and ranges were preserved beneath snowcover the entire winter. When snowcover left in March, good supplies of old grass were uncovered in most areas. Ranges are still essentially dormant but soil moisture promises new grass a good start.

MONTANA PASTURE & RANGE FEED CONDITION APRIL 1
by District as a Percent of Normal

CASH RECEIPTS
1978 Preliminary

Montana farmers and ranchers received 1,278 million dollars for crops and livestock marketed in Calendar Year 1978 according to preliminary USDA estimates. This is 34 percent more than 1977 and establishes a new record, exceeding by 11 percent the old record set in 1974. Income from the sale of livestock and products is 51 percent above 1977, while crops are up 14 percent.

Government payments to the State's farm and ranch operators added $137 million to Montana agricultural income. The major portion went through the wheat and feed grain programs to augment income from crops.

WHO OWNS THE LAND?

Private individuals and corporations own about 60 percent of the 2.3 billion acres of U. S. land, while the rest is owned by Federal, State and local governments and American Indians according to a recent USDA report.

About 7 to 8 million farm, ranch, and forest owners control close to 95 percent of all privately-held land, while the 2 percent of U.S. land used for housing is owned by between 47 and 58 million people. Commercial, industrial, recreational, and other uses account for the remaining 3 percent.

Single copies of *Facts About U.S. Landownership* (AIB-422) are available free by writing ESCS Publications, Room 0054, South Building, USDA, Washington, D.C. 20250.

WOOL PRODUCTION

Montana's wool production during 1978 fell 6 percent to 4.2 million pounds--the result of 10 percent fewer sheep and lambs shorn. The total number of sheep and lambs shorn at 415,000 was the lowest number since the early 1880s when the sheep industry began to become important in Montana. The average fleece weight for 1978 10.1 pounds compared with 9.7 pounds last year.

The average price received by Montana sheepmen for wool in 1978 was 81 cents per pound--up 6 cents from the previous year. The value of the clip was 3.4 million dollars--almost the same as last year.

Shorn wool production during 1978 for the United States totaled 101 million pounds--down 5 percent from 1977. The total 1978 wool production of 102 million pounds included 550 thousand pounds of pulled wool. Sheep and lambs shorn in 1978 at 12.5 million head, declined 5 percent from the previous year. Average fleece weight of shorn wool was 8.08 pounds--essentially unchanged from 1977.

Total value of shorn wool was $75.4 million, down 2 percent from $77.1 million in 1977. The average price per pound was 74.5 cents for 1978 compared with 72.0 in 1977.

AGRICULTURAL PRICES

The March Index of Prices Received by Montana farmers and ranchers at 265 (1967=100) was 13 points (5 percent) above last month and 69 points (35 percent) above last year. Price increases for All Livestock Items except hogs and lambs were responsible for most of the increase in the Index. The only crop item in the index to increase during the month was spring wheat. The price of all other items either went down or held steady.

The Index of Prices Paid by U. S. farmers increased 5 points (2 percent) to 246 percent of its January-December 1967 average. Contributing most to the increase since February were higher prices for cattle, calves, and eggs. Lower prices for hogs and lettuce were partially offsetting. The index was 46 points (23 percent) above a year ago.

The Index of Prices Paid by U. S. farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates for March 15 was 243--up 5 points (2 percent) from mid-February. Higher prices for feeder livestock, tractors and self-propelled machinery, fertilizer, other farm machinery and family living items accounted for most of the increase. The March Index was 29 points (14 percent) above a year earlier.

Cattle on Feed
Quarterly Egg Production
Potato Stocks

HOGS AND PIGS

MARCH 1 INVENTORY: Inventory of hogs and pigs on March 1, 1979 in the 14 States conducting quarterly hog surveys was estimated at 50.5 million head--up 13 percent from a year earlier. This is the largest March 1 inventory since 1971. The number kept for breeding at 8.34 million was up 20 percent from 1978 and 19 percent above 1977. The number for market at 42.2 million was 12 percent above 1978 and 14 percent more than 1977. Survey results indicate producers incurred death losses during the December-February quarter about 25 percent greater than last year. This was due to disease and severe winter weather--especially in the western Corn Belt States. The 14 quarterly States account for about 85 percent of the U. S. hog and pig inventory.

PIG CROP (DECEMBER 1978-FEBRUARY 1979: The December 1978-February 1979 pig crop in the 14 States totaled 18.3 million--17 percent more than both 1977 and 1978. There were 2.66 million sows farrowed in these States--up 16 percent from the previous year and 15 percent more than two years ago. Litter size averaged 6.87 pigs for the December 1978-February 1979 period compared with 6.84 a year earlier and 6.76 two years ago.

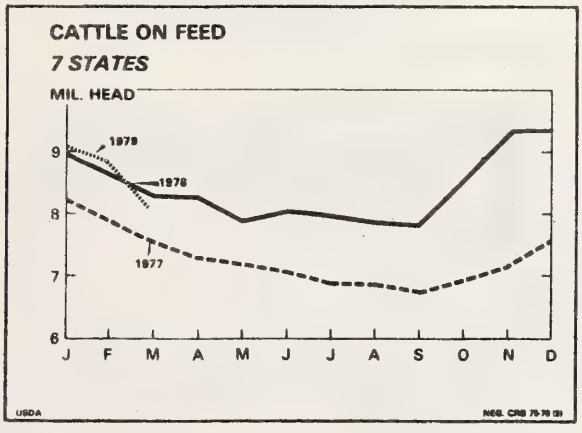
FARROWING INTENTIONS: Producers in the 14 quarterly States intend to have 3.55 million sows farrow in the March-May 1979 period--24 percent more than last year and 23 percent above 1977. Farrowing intentions reported for the June-August 1979 period are 3.16 million sows--19 percent above 1978 and 22 percent more than 1977.

CONSUMER PRICE INDEX

The February CPI for all urban consumers, 1967 base, was 207.1. This was up 1.2 percent (2.4 points) from January and up 9.9 percent (18.7 points) from February 1978.

CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed March 1 for slaughter market in the 7 States preparing monthly estimates (Arizona, California, Colorado, Iowa, Kansas, Nebraska, and Texas) totaled 8.21 million head--down 1 percent from a year ago but 9 percent more than March 1, 1977. Marketings of fed cattle during February totaled 1.65 million--down 2 percent from last year but 5 percent more than February 1977. Placements of cattle and calves on feed in the 7 States during February were 1.31 million--down 14 percent from last year and 4 percent less than February 1977. Net placements of 1.14 million were down 15 percent from last year and off 9 percent from February 1977. Other disappearance totaled 170 thousand compared with 181 thousand in February 1978 and 112 thousand in 1977.



LIVESTOCK SLAUGHTER

Montana slaughter plants produced 19 percent less red meat during February 1979 than during the same month a year ago. Total production for February at 9.8 million pounds compares with 12.1 million pounds last February and 12.2 million pounds during January 1979. The total red meat production at 22.0 million pounds for the first two months of 1979 is 13 percent less than the same period a year ago.

Commercial red meat production for the United States in February 1979 totaled 2.76 billion pounds--down 9 percent from February 1978. January-February red meat production at 6.04 billion pounds was 4 percent below last year... change by individual components: beef, down 6 percent; veal down 35; pork, up 4; lamb and mutton, down 4 percent.

SPOTLIGHT ON HAMBURGER

Because more hamburger (including ground beef) is consumed than any other type of meat, it is noteworthy when its price nearly doubles in 2 years. In fact, an estimated 27 percent of consumers' expenditures for beef products is for hamburger.

Retail prices of hamburger, already at record highs, are likely to continue climbing in 1979 since prices for nonfed cattle are predicted to increase through the remainder of the year. Also, estimated marketing margins for hamburger from utility cows are the lowest percentage of retail cost since 1973. Processors, wholesalers, and retailers may attempt to restore previous margins which would also act to push up prices.

Boneless cow meat is one of the major sources of meat for use in hamburger--and the recent decline in cow and other nonfed beef slaughter is a major reason for the price increase. However, a variety of fat and lean cuts can be used, providing the end product is at least 70 percent lean.

MARKETING MARGINS FOR HAMBURGER

	1975	1976	1977	1978	1979 1/

	Percent				
Marketing margin	48	34	35	32	29

1/ Estimates for week ending February 9.
2/ Assumed to be 2.58 times the price of utility cows at Omaha.

EGG PRODUCTION

Montana's laying flocks produced 46 million eggs during the December 1, 1978 to February 28, 1979 quarter--down 2 percent from the same period a year ago. The number of layers on March 1 at 810,000 was down 2 percent from last year. The reduction in layers was partially offset by a higher rate of lay--67.0 compared with 62.8 on March 1, 1978.

The nation's laying flocks produced 17.1 billion eggs during the December 1, 1978 to February 28, 1979 period--up 3 percent from the same quarter a year ago. The number of layers on March 1 at 289 million compares with 281 million a year earlier. Rate of lay on March 1 averaged 65.0 eggs per 100 layers compared with 64.7 on the same date a year ago.

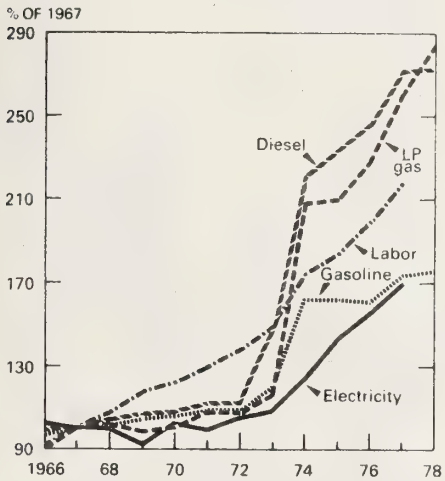
ENERGY

The dramatic increase in energy prices during 1973-74 slowed considerably for gasoline and diesel fuel in 1978. LP gas, electricity and natural gas prices however continue to rise. Although energy costs make up only 8 to 12 percent of farmers' production costs, farming is becoming increasingly energy intensive--partially as a reaction to high labor costs. Despite increasing energy costs, a move back to labor-intensive agriculture is unlikely, since labor is over 880 times as expensive as electricity per hour of work performed.

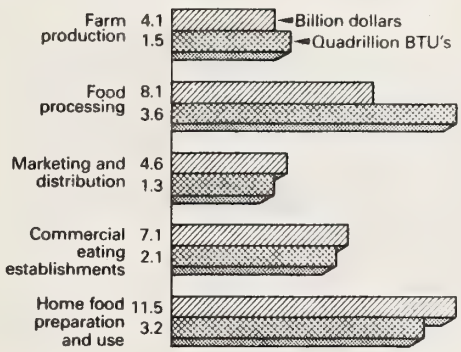
The food system uses one-sixth of all energy used in the United States. Because of all the special forms and processing of foods that have been developed, as well as the increase in eating outside the home, actual production accounts for only a fifth of the food systems' total energy use.

The use of pesticides and fertilizers which account for more than a third of the energy used in actual agricultural production has trended upward. Fertilizer nutrient use per acre is 5 times the 1950 rate and is a main reason for increased crop yields. However, increasing energy costs tend to restrain the use of some agricultural chemicals.

ENERGY PRICES PAID BY FARMERS



ENERGY USED IN U.S. FOOD SYSTEM



Billion dollars
Quadrillion BTU's
Farm production 4.1 1.5
Food processing 8.1 3.6
Marketing and distribution 4.6 1.3
Commercial eating establishments 7.1 2.1
Home food preparation and use 11.5 3.2

SHEEP AND LAMBS ON FEED DOWN

The number of sheep and lambs on feed in seven selected States (Arizona, California, Colorado, Iowa, Nebraska, Texas, and Wyoming) on March 1, 1979 totaled 604 thousand head--down 8 percent from the 659 thousand head on feed a year ago. There were 306 thousand placed on feed during January and February this year--up 1 percent from the 302 thousand placed during the same period a year ago. Of the total number on feed March 1, 1979, 8 percent weighed less than 70 pounds, 6 percent weighed 70-79 pounds, 14 percent weighed 80-89 pounds, 30 percent weighed 90-99 pounds, and 42 percent were 100 pounds and over.

POTATO STOCKS

On March 1, 1979 Montana potato farmers [illegible] 1.75 million cwt. in storage--1 percent below last year. The majority of these potatoes will be shipped during March.

Nationally, there were 129 million cwt. of potatoes in storage on March 1, 1979. This was 6 percent above last year and 13 percent more than 1977.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 350,[illegible] pounds of creamed cottage cheese during Feb[illegible]y, a 22 percent increase over last year. Ice cream production at 106,000 gallons was up 4 percent. Butter production showed a 4 percent decline to 180,000 pounds; however, this was 2 percent above the 1977 production.

A REMINDER

Many of you are on our mailing list to receive reports of various commodities which are available in the "Montana Crop and Livestock Reporter" this year. Under provisions of law, these reports can be sent only to those who specifically request them each year. If you receive a letter from our office asking you to check the reports you desire, please do so and return it by the specified date or your name will be removed from our mailing list.

This brings up another point--our mailing lists are very large and we spend considerable time updating our name and address records. Occasionally we may slip up on this and end up offending someone. We may misspell a name or have more than one version of the same address. If this ever happens to your address, please let us know. Sending us a corrected version and the incorrect address label from a report we have sent you makes it easier for us to correct the problem. Your help in this is appreciated.

CATTLE--1979 AT A GLANCE
(Reprint from the February 1979 Livestock and Meat Situation)

Beef production during 1979 may be down 6 percent from a year ago and 12 percent below the peak production of 1976. In 1976, per capita beef consumption exceeded 129 pounds, carcass weight. Consumption was reduced to 120.4 pounds per person in 1978. This year, it will be less than 115 pounds--a 6-year low.

As the liquidation phase of the cattle cycle winds down, a larger percentage of the U.S. cattle slaughter will come from feedlots. Despite the 7 percent smaller inventory of calves and yearlings (excluding replacement heifers) outside feedlots January 1, placements on feed are expected to about match those of a year ago.

Net imports of live cattle from Canada and Mexico were about 1.1 million head in 1978. Mexico accounted for about 700,000 of this total with the majority in the 200-700-pound feeder cattle category. Live cattle imports from Mexico since 1972 have ranged from a high of almost 916,000 head in 1972 to a low of 196,000 in 1974. The high level of 1978 shipments of feeder cattle was due in part to a drought in the 10 northern cattle-raising States of Mexico. For 1979, a substantial drop in live cattle exports to the United States is expected since most ranchers in the northern States of Mexico will be rebuilding herds.

Substantial increases in yearling and calf prices as a result of both increased feedlot demand and smaller numbers will sharply curtail slaughter of these animals. Calf slaughter may be reduced about 40 percent from last year, whi slaughter of steers and heifers off grass could be cut back 50 to 60 percent. These reductions would add about 4 million head to available feeder cattle inventories. Projected marketings of fed cattle are maintained at approximately the 1978 level. Feedlot cattle would then account for 75 percent or more of this year's cattle slaughter--up from 69 percent in 1978. This wil support prices of slaughter animals associated with processed items such as hamburger.

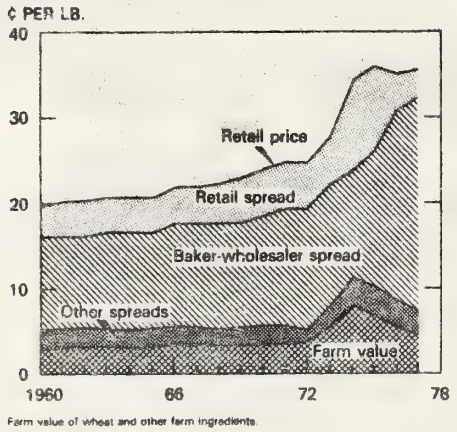
FOOD MARKETING COSTS

By type of business, marketing functions performed by retailers account for 27 percent of the marketing bill; processors, 26 percent; restaurants and other away-from-home eating places, 24 percent; wholesalers, 15 percent; and transportation, 8 percent.

Increases in farm-retail price spreads and the food marketing bill are largely due to inflation in the costs of inputs used in marketing food products. In recent years, substantial cost increases have occurred for nearly every input--particularly labor and energy-related items.

White pan bread illustrates the impact of marketing charges on the retail price of highly processed foods--baking and distribution costs have accounted for most of the bread price rise.

CONSUMER'S BREAD PRICE AND WHERE IT GOES



Farm value of wheat and other farm ingredients.

MANUFACTURED DAIRY PRODUCTS

January ice cream production in Montana at 11,000 gallons was down 9 percent from last year. Other major dairy products showed good gains. Butter production at 240,000 pounds was up 3 percent and production of creamed cottage cheese at 384,000 pounds was up 23 percent from a year earlier.

WHEAT OUTLOOK FOR 1979/80

(Reprint from the February 1979 Wheat Situation)

Preliminary indications point to reduced 1978 crop carryover and larger wheat production in 1979. Based on the winter wheat production forecast and increased planting intentions of spring wheat growers, total 1979/80 supplies could be between 2.8 and 3.1 billion bushels. As of December 1, 1978, winter wheat production for 1979 was estimated at 1.44 billion bushels but there are always uncertainties which remain until the crop is harvested. Analysis of past differences between the December and the final estimates indicate that the winter wheat crop should vary from the December forecast by less than 110 million bushels in 2 out of 3 years.

With larger U.S. wheat production a strong prospect for 1979, expanded demand will be required if current market prices are to be maintained. A small increase in domestic food use seems probable, but the demand outlook depends mostly on the world grain situation. With large wheat crops in most countries, including other exporting countries during 1978/79, U. S. exports will weaken until mid-1979. After that, the outlook depends largely on the size of Northern Hemisphere wheat and coarse grain crops outside of the United States--particularly in the USSR, China, Europe, Canada, and India.

AGRICULTURAL PRICES

The Index of Prices Received by Montana farmers and ranchers for all farm products on February 15 at 252 (1967=100) was up 7 points (3 percent) compared with the previous month. The Index was 68 points (37 percent) above the previous year. The February All Crops Index at 200 was 2 percent above last month. The February Livestock and Products Index at 292 was up 4 percent. Price increases were noted for most products but declines occurred for barley, hogs, milk, and eggs. Wool prices remained unchanged.

The February Index of Prices Received by U.S. Farmers increased 8 points (3 percent) to 240 percent of its January-December 1967 average. Contributing most to the increase since January were higher prices for cattle, soybeans, hogs, calves, oranges, and broilers. Lower prices for cotton, potatoes, turkeys and barley were partially offsetting. The Index was 47 points (24 percent) above a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates for February 15 was 238--up 4 points (2 percent) from mid-January. Higher prices for feeder livestock, feed, building and fencing materials, fuels and energy, and family living items accounted for most of the increase.

CONSUMER PRICE INDEX

The January CPI for all Urban consumers, 1967 base, was 204.7. This was up 0.9 percent (18 points) from December and up 9.3 percent (17.5 points) from January 1978.

WHEAT UTILIZATION

Montana wheat shipped to out of State destinations during the 1977 wheat marketing year (June 1977-May 1978) totaled 102.6 million bushels--including unaccounted disappearance. This represents 85 percent of the available supply. Use in the State for feed, seed and flour amounted to 18.2 million bushels.

In the 1977 marketing year, 90.6 million bushels of Montana wheat were shipped to the Pacific Northwest--including an allowance for unaccounted disappearance. Pacific Northwest flour mills used 19.9 million bushels and 70.7 million were exported from Pacific Northwest ports. By comparison, in 1976 flour mills used 21.0 million bushels and 63.5 million were exported. Montana wheat accounted for 57 percent of the Pacific Northwest exports in 1977--down slightly from 1976.

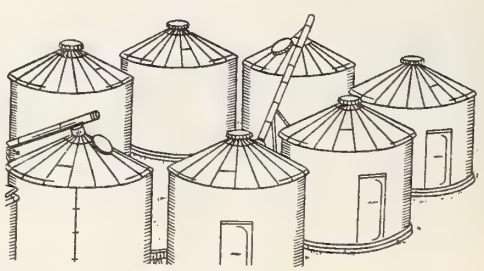
MEAT IMPORT LIMIT

President Carter directed USDA and the State Department to negotiate agreements with meat exporting countries to limit total 1979 U.S. imports of fresh, chilled, and frozen beef veal, mutton, and goat meat to 1,570 million pounds. The decision is consistent with the President's statement to cattle producer representatives July 25 that he would not permit unlimited beef imports in 1979. The allowable import level during 1978 was 1,492 million pounds, with a slight increase in actual shipments coming in the second half of the year. Prorated on a monthly basis, the new level will permit meat imports at the same rate as during the last 6 months of 1978.

MONTANA PRODUCER-OWNED GRAIN STOCKS

Wheat producers retained pricing control on 15 million bushels stored off farm on January 1, 1979 or 63 percent of the total. This was slightly below a year ago when producers controlled 64 percent of the off-farm stocks. Producer control of off-farm stored barley amounted to 2.4 million bushels or 52 percent of all off-farm stored barley on January 1, 1979. A year ago, growers controlled 45 percent of total off-farm storage.

Producer-owned grain in commercial off-farm storage facilities is defined as grain for which the producer has some marketing control.



LIVESTOCK SLAUGHTER

Montana slaughter plants produced 7 percent less red meat during January 1979 than during the same month a year ago. Total production for January at 12.2 million pounds compares with 13.0 million pounds last January and 10.5 million pounds during December 1978.

National slaughter data which determine meat supplies and affect prices shows: red meat production in January 1979 totaled 3.28 billion pounds--up 2 percent from January 1978. Change by individual components were as follows: beef, virtually unchanged from January 1978; veal, down 34 percent; pork, up 9 percent; lamb and mutton, down 8 percent.

JANUARY 1979 LIVESTOCK SLAUGHTER

1/ Number of feedlots with 1,000 head or more capacity is number of lots operating any time during year. Number under 1,000 head capacity and total number of feedlots is number at end of year.
* Lots and marketings from larger size groups in Montana are included to avoid disclosing individual operations.

POTATO STOCKS UP

Montana potato growers and local dealers had 1.83 million cwt. of potatoes in storage as of February 1, 1979. This is 2 percent above last year. Disappearance since harvest amounted to 258,000 cwt.

Nationally, 159 million cwt. of potatoes for all uses were in storage on February 1, 1979. This was 6 percent above a year earlier and 11 percent more than 1977. Disappearance of the 1978 fall crop as of February 1, 1979 was 154 million cwt., which includes potatoes diverted to February 1 under the USDA division program. The total disappearance includes 22.6 million cwt. of potatoes that were dumped, fed to livestock on potato farms, or loss due to shrinkage.

MONTANA CATTLE NUMBERS DECLINE

Despite abundant range and hay for feed, Montana ranchers continued to reduce their cattle herds during 1978. As of January 1, 1979 there was an estimated 2,607,000 head on Montana farms and ranches. This is down 3 percent from January 1, 1978 and represents the fifth year of inventory reduction.

By class, steers were down 7 percent, calves less than 500 Lbs. were down 21 percent, and other heifers (not for replacement) were down 3 percent. The sharp reduction in calves reflects a smaller calf crop (1,433,000--down 6%) and a very strong demand for feeders. Classes showing gains were beef cows and beef replacement heifers. Beef cows that have calved were up 3 percent from January 1, 1978 and heifers being held for replacement stock showed an 18 percent increase over last year.

Nationally, the total cattle inventory also continues to decline. There was an estimated 110.9 million head of cattle on January 1, 1979, down 5 percent from last year. In the U. S., this is the fourth year of herd reduction in the current cattle cycle. All classes of cattle except dairy replacement heifers showed declines at the U. S. level.

AGRICULTURAL PRICES

The Index of Prices Received by Montana farmers and ranchers was up 15 points (7 percent) at 245 on January 15 compared with the previous month. Compared with last year, the Index was up 74 points. The primary reason for the sharp increase was improved prices for meat animals.

The January Index of Prices Received by U.S. farmers increased 10 points (5 percent) to 232 percent of its January-December 1967 average. Contributing most to the increase since December were higher prices for cattle, lettuce, hogs, broilers, and soybeans. Lower prices for cotton, eggs, and oranges were partially offsetting. The index was 46 points (25 percent) above a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates for January 15 was 233--up 7 point (3 percent) from mid-December. Higher prices for feeder livestock and family living items plus the annual updating of the indexes for interest, taxes and farm services and cash rent accounted for most of the index rise. The January index was 24 point (11 percent) above a year earlier.

SHEEP LONGTERM DECLINE CONTINUES

Montana's sheep and lamb inventory dropped 10 percent in 1978, but stock sheep and lambs registered only a 3 percent decline. The total sheep and lamb inventory at 475,000 head on January 1, 1979 was at about the same level the State had in the early 1880s. However, in those early years sheep numbers were climbing steadily--reaching a peak in 1903 with 5,736,000 head. Numbers then started down but revived in the late twenties and then stabilized during the thirties and early forties near 3.5 million head. Since 1943 it's been mostly downhill.

Although much smaller, the sheep industry in Montana today is healthy and showing signs that may be signaling growth. The total value of all sheep and lambs in the State increased 40 percent in 1978 to 42.3 million dollars--inspite of the fewer numbers. Also, ewe lambs on Montana farms and ranches increased 26 percent to 111,000 head--pointing to a possible flock buildup. However, the number of lambs saved in 1978 as a percent of ewes over one year of age on hand at the beginning of the year was only 98 percent--down 3 points from 1977. This means sheepmen are still having a problem with predator losses and disease. The total lamb crop for 1978 at 349,000 head was down 7 percent.

There was an estimated 2,000 operations with sheep in Montana during 1978--100 less than the previous year.

Nationally, the number of sheep and lambs on farms January 1, 1979 was 12.2 million head, 1 percent less than last year--almost leveling off. This is the smallest inventory since records were begun in 1867.

MONTANA CHICKEN NUMBERS DOWN

The number of chickens on Montana farms December 1, 1978 totaled 930,000--down 8 percent from the 1,015,000 on farms a year earlier. The inventory included 740,000 hens and pullets of laying age and 186,000 pullets not of laying age. The inventory value of all Montana chickens December 1, 1978 dropped 13 percent to $1,721,000. The average value per head at $1.85 was 10 cents less than the previous year.

Nationally, the number of chickens on December 1, 1978 at 395 million was up 2 percent. The inventory value rose 6 percent to $691 million.

79-2 Issued Twice Monthly January 29, 1979

This is the second issue of the "Reporter" covering statistics released during the last two weeks (since the first issue was published). In the near future, we expect receipt of equipment enabling us to publish the "Reporter" to an 8½ X 11" size. This will provide more room for material and charts, larger print, and match the size of most other publications. In condensing material for this release, formerly carried in separate commodity reports, we find it necessary to eliminate some data--mostly national figures and statistics for other States. Those interested in more detail, etc., can write---P. O. Box 4369, Helena, Montana or call 449-5303 for additional information. As expressed in the first issue, we are also anxious to hear from data users on suggestions for improvement, etc. Many will receive only those issues of the "Reporter" covering commodities you have requested--if you require all issues, let us know.

Daniel L. Herbert,
State Statistician

PROSPECTIVE PLANTINGS

Montana's farmers and ranchers current spring planting intentions plus winter wheat acreage planted in the fall of 1978 indicate a 1 percent increase in the acreage of the main crops for 1979. A January survey revealed intentions of 5 percent more hard spring wheat, 6 percent more corn, but 13 percent less durum, 12 percent less oats, 3 percent less barley, and 2 percent less sugarbeets than planted in 1978.

Acreages actually planted this year may vary from those indicated for such reasons as weather, economic conditions and participation in farm programs.

* Indicated.

MILK PRODUCTION

Montana dairy farmers produced 69 million pounds of milk during the October-December quarter. This was 3 percent less than the same quarter in 1977. Based on 27,000 dairy cows, this amounts to 2,540 pounds of milk per cow for the quarter. As of January 1, dairy farmers were feeding milk cows about 12 pounds of grain and other concentrates daily.

The U. S. October-December milk production totaled 29.0 million pounds--about the same as the previous year.

HONEY PRODUCTION ABOVE NORMAL

Montana's 1978 honey crop is 61 percent above last year's very poor crop. The 1978 production of 8.8 million pounds was exceeded only in 1969 and 1976 during the last 15 years. The number of colonies at 99,000 was only 3 percent above last year, but the yield per colony was 89 pounds in 1978 compared with last year's 57 pounds per colony. In 1978 Montana ranked 6th in the U. S. honey production. Stocks of honey on hand for sale in Montana by honey producers were 793,000 pounds on December 15, 1978--up considerably from 383,000 pounds last year on this same date.

The U. S. honey crop at 230 million pounds was up 29 percent from last year. The number of colonies at 4.1 million was down 6 percent, but the yield at 56.4 pounds was up 15.3 pounds from last year. Honey stocks on hand totaled 32 million pounds--6 percent above last year.

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 22 percent less red meat during December 1978 than during the same month a year ago. The Calendar Year 1978 Montana red meat production at 145.9 million pounds is 13 percent less than the 1977 red meat production.

National slaughter data which determine meat supplies and affects prices shows: red meat production in December 1978 totaled 3.09 billion pounds--down 5 percent from December 1977. January-December red meat production at 38.1 billion pounds was 3 percent below last year...change by individual components: beef, down 4 percent; veal, down 24; pork, up 1; lamb and mutton, down 12 percent.

JANUARY GRAIN STOCKS

Wheat stored on Montana farms and in mills and elevators January 1, 1979 totaled 155.2 million bushels--4 percent above last year. Record-high disappearance since October 1 of 36.2 million bushels reduced the buildup of stocks. Farm storages held 131.4 million, nearly 4 percent above a year ago and commercial storages held 23.8 million--9 percent more than January 1, 1978. Winter wheat in all positions totaled 84.8 million bushels--4 percent below last year. Spring wheat excluding durum was 60.6 million bushels--15 percent above one year ago. Durum in storage amounted to 9.8 million bushels--up 30 percent. Barley stocks were up 19 percent at 49.8 million and oats stocks at 10.8 million were up 76 percent.

Nationally, all wheat in storage totaled 1.63 billion bushels--18 percent less than last year's 1.99 billion. U. S. barley stocks in all positions totaled 38.7 million bushels--17 percent above a year earlier and the highest January 1 stocks since 1972.

CATTLE ON FEED

Cattle and calves on feed for the slaughter market in Montana feedlots on January 1 totaled 80,000 head--1 percent less than last January but over 2½ times the number on feed October 1978. An estimated 19,000 head were marketed from feedlots from October 1 through December 31--a 19 percent increase from the same quarter in 1977. Placements in lots during the October-December period totaled 72,000 head--up 22 percent from last year. Montana feeders expect to market 35,000 head during the January-March period--19 percent less than the same period last year.

For the 23 major feeding States, cattle and calves on feed totaled 12.7 million head--1 percent less than in feedlots a year ago, but 12 percent above the October 1, 1978 number. Placements during the last three months at 8.7 million head are down 9 percent from a year ago. Marketings of fed cattle for slaughter the past quarter totaled 6.7 million--up 11 percent from last year.

79-1 | Issued Twice Monthly | January 16, 1979

"NEW BI-MONTHLY REPORT FOR 1979"

This is the first issue of the new 'Montana Crop and Livestock Reporter", in which we plan on consolidating statistical material previously published in individual commodity reports. It will be issued twice each month and should provide a comprehensive compilation of various agricultural statistics. Combining reports should benefit both the government and the taxpayer, as savings can be realized in printing, paper and especially postage. The consolidated report will contain both narrative and tables pertaining to crop, livestock, and price information released the previous two weeks for Montana and the United States--similar to individual reports in the past. However, space may be short in some issues and detail may be limited for some commodities but this can be provided upon request.

Press releases will be sent to the news media for indivudal reports as they are released, so producers and the public can continue receiving the information in a timely manner.

As with any new venture, we may make a few slipups. However, we do want to continue presenting the information in a way most useful to you. As we go along, if you have suggestions for improving our report, please give us the benefit of your ideas.

HAY STOCKS

January 1 Hay Stocks on Montana farms and ranches totaled 3,981,000 tons--8 percent more than on the same date last year. Ample supplies of hay are available but heavy feeding caused by below-normal temperatures could influence late winter supplies.

The United States Hay Stocks on farms January 1 totaled 98.1 million tons--7 percent above a year earlier.

AGRICULTURAL PRICES

MONTANA

The Index of Prices Received by Montana farmers and ranchers was up 2 points (1 percent) on December 15 compared with the previous month. The December 1978 index at 229 (1967=100) compares with 164 in December 1977. The monthly increase in the index was mostly due to increases in meat animal prices. The December All Crops Index at 197 was down 7 points (3 percent) from the November index. Price declines occurred for winter wheat, durum, barley, and oats. Prices went up for hay. Spring wheat remained the same. The December Livestock and Products Index at 254 was up 10 points (4 percent from November. Prices increased for beef, cattle, calves, lambs, hogs, and eggs. Prices went down for sheep and milk. Wool remained steady.

UNITED STATES

The December Index of Prices Received by U. S. Farmers increased 6 point (3 percent) to 221 percent of its January-December 1967 average. Contributing most to the increase since November were higher prices for cattle, hogs, eggs, calves, corn, and soybeans. Lower prices for wheat, citrus and barley were partially offsetting. The index was 40 points (22 percent) above a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates for December 15 was 226--up 2 points (1 percent) from mid-November. Higher prices for feeder livestock, feed and family living items were the major contributors to the index rise. The index was 23 points (11 percent) higher than a year earlier.

FARM AND RANCH NUMBERS

Montana farm numbers continue to decline with the 1978 count at 23,000--down 300 from a year ago. Land in Montana farms at 62.3 million acres was the same as the previous year.

Starting in 1978, a new series of farm numbers is being initiated based on a new farm definition. The "New Definition" of a farm includes places which had annual sales of agricultural products of $1,000 or more. This definition is also being used by the Department of Commerce, Bureau of the Census, for 1978 Census of Agriculture.

Under the "New Definition", Montana had 22,000 farms in 1978, with a preliminary estimate of 21,700 for 1979. Total land in farms for 1978 was 62.1 million acres and a preliminary estimate of 62.0 million acres for 1979.

The United States farm numbers dropped 34,000 to 2.67 million in 1978. Land in farms at 1,072 million acres decreased 3 million acres from the previous year.

Under the "New Definition" there were 2.37 million farms in the U. S. in 1978, with a 1979 preliminary estimate of 2.33 million. Total land in farms for 1978 was 1,052 million acres and the preliminary estimate for 1979 is 1,049 million acres. The change in farm definition reduced the number of farms by 11 percent for 1978. Land in farms estimates were reduced 2 percent under the new definition.

HOG NUMBERS UP

On December 1, 1978 Montana pork producers had 5 percent more hogs and pigs on hand than a year earlier. An estimated 222,000 head were on Montana farms this December 1. Market hogs at 193,000 were up 7 percent but breeding hogs at 29,000 were down 3 percent from last year.

The fall pig crop farrowed during June-November at 158,000 was up 10 percent and the spring pig crop (Dec.-May) at 173,000 was up 21 percent.

Nationally, the December 1 hog inventory at 59.9 million hogs and pigs is 6 percent above last year--9 percent more than December 1, 1976 and the largest December 1 inventory since 1974. Breeding stock was up 11 percent and market hogs were up 5 percent from last year. The spring pig crop (Dec.-May) was down 1 percent but the fall pig crop (June-November) was up 6 percent from last year.

Hog producers in the U.S. intend to farrow 6.9 million hogs during December 1978-June 1979, an increase of 15 percent from last year.

MANUFACTURED DAIRY PRODUCTS

Montana butter production during November totaled 172,000 pounds--4 percent less than November 1977. The U. S. November butter production at 66.7 million pounds was 18 percent less than last year. Ice cream plants in Montana produced 108,000 gallons during November--4 percent less than last year. The U. S. ice cream production was 58.2 million gallons--3 percent more than November 1977.

POTATO STOCKS UP

Montana potato growers and local dealers had 1.87 million cwt. of potatoes in storage as of January 1, 1979. This is 3 percent above last year. Disappearance since harvest (including sales, shrink, home consumption, etc.), amounted to 218,000 cwt.

Nationally, an estimated 190 million cwt. of potatoes for all uses were in storage in the fall-producing areas on January 1, 1979. This was 7 percent above a year earlier and 9 percent more than 1977.

Disappearance of the 1978 fall crop to January 1, 1979 was 123 million cwt. (excluding Nevada)--a decrease of 1 percent from last year. The total disappearance of 19.6 million cwt. includes potatoes that were dumped during grading, fed to livestock on potato farms, discarded without grading and loss due to shrinkage (moisture loss).

HIGHLIGHTS:

Cattle on Feed
Red Meat Production
Milk Production
Egg Production
December 1 Potato Stocks
Final Acreage and Grain Stocks for 1993-1997
December 1 Hog & Pig Inventory

U.S. Cattle on Feed Down 4 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 11.03 million head on December 1, 1998. The inventory was 4 percent below December 1, 1997 but 4 percent above December 1, 1996.

Placements in feedlots during November totaled 2.05 million, 7 percent below 1997 and 13 percent below 1996. Net placements were 1.97 million. During November, placements of cattle and calves weighing less than 600 pounds were 740,000, 600-699 pounds were 557,000, 700-799 pounds were 437,000, and 800 pounds and greater were 317,000.

Marketings of fed cattle during November totaled 1.70 million, 2 percent above 1997 and slightly above 1996. Other disappearance totaled 78,000 during November, 8 percent below 1997 and 16 percent below 1996.

Montana Red Meat Production Down, United States Up

Montana slaughter plants produced 1.4 million pounds, dressed weight of red meat during November, up 18 percent from November 1997, but down 10 percent from the previous month. Cattle slaughter totaled 1,500 head, 100 head more than a year ago. The average live weight, at 1,128 pounds, was up 21 pounds from last year ago. The average live weight, at 227 pounds, was up 1 pound from a year ago. The number of sheep slaughtered, at 200 head, was unchanged from a year ago. The average live weight decreased 4 pounds from last year to 122 pounds.

During November, there were 2,200 hogs slaughtered, 700 head more than a year ago. The average live weight, at 227 pounds, was up 1 pound from a year ago. The number of sheep slaughtered, at 200 head, was unchanged from a year ago. The average live weight decreased 4 pounds from last year to 122 pounds.

Commercial red meat production for the United States totaled 3.73 billion pounds in November, up 8 percent from the 3.45 billion pounds produced in November 1997. January - November red meat production was 41.2 billion pounds, 4 percent above the comparable figure a year earlier. Accumulated beef production was 1 percent higher than last year, veal was down 23 percent, pork was up 10 percent, and lamb and mutton was down 4 percent.

U.S. beef production, at 2.00 billion pounds, was 4 percent above the previous year. Cattle slaughter totaled 2.77 million head, up 1 percent from 1997. The average live weight was up 23 pounds from the previous year, at 1,211 pounds.

Veal production totaled 19.0 million pounds, 19 percent below a year ago and 17 percent below the previous record low for November set in 1992. Calf slaughter totaled 112 thousand head, down 10 percent from November 1997. The average live weight was 28 pounds below last year, at 285 pounds.

Pork production totaled 1.68 billion pounds, up 14 percent from the previous year and 3 percent above the previous record high for November set in 1994. This marked the fifth successive month and the eighth month overall in 1998 for record high pork production. Hog kill totaled 8.81 million head, 14 percent above 1997. The average live weight was 1 pound above the previous year, at 261 pounds.

Lamb and mutton production, at 19.0 million pounds, was down 5 percent from the previous record low for November set in 1997. Sheep slaughter totaled 298 thousand head, 4 percent below last year. The average live weight was 130 pounds, down 4 pounds from November a year ago.

November Milk Production Up 3 Percent in 20 Major States

Milk production in the 20 major States during November totaled 10.9 billion pounds, up 3.0 percent from production in these same States in November 1997. October revised production, at 11.2 billion pounds was up 1.7 percent from October 1997.

Production per cow in the 20 major States averaged 1,408 pounds for November, 39 pounds above November 1997. The number of cows on farms in the 20 major States was 7.75 million head, 9,000 head more than November 1997 and unchanged from October 1998.

U.S. November Egg Production Up 2 Percent

U.S. egg production totaled 6.71 billion during November 1998, up 2 percent from the 6.57 billion produced in 1997. Production included 5.69 billion table eggs and 1.02 billion hatching eggs, of which 965 million were broiler-type and 58.0 million were egg-type. The total number of layers during November 1998 averaged 318 million, up 3 percent from the total average number of layers during November 1997. November egg production per 100 layers was 2,109 eggs, down one percent from 2,122 eggs in November 1997.

All layers in the U.S. on December 1, 1998, totaled 320 million, up 3 percent from a year ago. The 320 million layers consisted of 263 million layers producing table or commercial type eggs, 54.8 million layers producing broiler-type hatching eggs, and 2.51 million layers producing egg-type hatching eggs. Rate of lay per day on December 1, 1998, averaged 70.7 eggs per 100 layers, down fractionally from the 71.0 a year ago.

Laying flocks in the 30 major egg production States produced 6.34 billion eggs during November, up 2 percent from November 1997. The average number of layers during November, at 301 million, was up 3 percent from a year earlier.

PLEASE RETURN

Montana Potato Production and December 1 Stocks Down 4 Percent

Montana potato growers produced 3,180,000 cwt of potatoes in 1998, 4 percent less than last year. The 1998 acreage was up 200 acres from last year, but the average yield was 20 cwt less. There were 10,600 acres harvested with an average yield of 300 cwt per acre compared with 10,400 acres and an average yield of 320 cwt in 1997.

Producers held 3,050,000 cwt in storage on December 1, 4 percent less than stocks on hand a year earlier. December 1 stocks represented 96 percent of the 1998 production, the same as a year earlier.

The 15 major potato States held 281 million cwt of potatoes on December 1, 1998, up 1 percent from last year but 5 percent below 1996. Storage accounted for 66 percent of 1998 fall production, two percentage points below last year. Stocks by type were 3 percent red, 11 percent round white, 4 percent long white (Shepody), and 82 percent russet; more russets and fewer long whites are in storage than a year ago.

Disappearance in the 15 States from the start of harvest to December 1 was 144 million cwt of potatoes, up 7 percent from the same period last year but 2 percent less than the record in 1996. Shrink and loss so far this year was increased almost 10 percent from 1997 to 17.1 million cwt, up from the 15.6 million cwt lost a year ago but 6 percent below the 18.1 million cwt lost in 1996.

Processing of 1998 potatoes totaled 74.0 million cwt used so far this season. This is up 8 percent from a year ago but 5 percent below two years ago.

Western States held 195 million cwt of potatoes in storage on December 1, slightly above a year ago but 4 percent below two years ago. California and Washington had more potatoes on hand than a year ago but the other Western States had less. Washington's stocks were up 4 percent and California gained 11 percent. Idaho had 1 percent fewer stocks, Oregon was down 2 percent. Colorado was down 3 percent and Montana dropped 4 percent.

Total U.S. production of fall potatoes for 1998 is forecast at 434 million cwt, up 3 percent from last year but 4 percent below 1996. Area harvested, at 1.22 million acres, is up 4 percent from last year but 2 percent below 1996. The average yield is forecast at 356 cwt per acre, down 3 cwt from last year and 8 cwt below two years ago. Planting started on time this year and most States had good early weather. A hotter than normal summer in Western States caused rougher and smaller potatoes and lower yields. Harvest in the West was delayed as long as possible to gain more size. Central and Eastern States had good size and yields. Compared with last month, an increase in production was indicated in Idaho, Washington, Wisconsin, and Michigan.

Total potato production from all four seasons is estimated at 476 million cwt in 1998, up 2 percent from last year but 4 percent below the record large crop of 1996.

The ten Western States produced 297.2 million cwt in 1998, up 1 percent from last year but 5 percent below two years ago. Acreage harvested, at 748,500 acres, increased 4 percent, while the average yield of 397 cwt per acre was down 14 cwt from a year ago. Summer heat led to smaller sizes, lower solids, and rougher potatoes in the Western States. Higher acreage gave Washington a 6 percent larger crop even though yields were down. Good yields in Colorado increased production by 1 percent and Wyoming by more than 7 percent. Production is down in all other Western States primarily because of lower yields. Production in Idaho slid less than 1 percent from last year, Oregon is off 3 percent, and California dropped 12 percent. New Mexico and Utah production fell 15 and 20 percent respectively. Nevada's production dropped 8 percent and Montana lost 4 percent from last year.

1/ Stocks include processor holdings and seed to plant 1999 crop. 1998 crop seed usage totaled 29.6 million cwt.

Final Acreage and Grain Stocks Estimates for 1993-1997

The acreage and grain stocks estimates were reviewed by the National Agricultural Statistics Service for the1993 through 1997 crop years. Revisions were made after a thorough review of the original survey data and all additional available data including the 1997 Census of Agriculture. The Agricultural Statistics Board evaluated the current acreage with historic totals to ensure comparability with past Census relationships. The estimates are considered final and will not be revised again.

Montana's 1996 barley planted and harvested acreage was reduced 50,000 acres to 1,250,000 acres and 1,150,000 acres, respectively. The yield remained unchanged at 43 bushels per acre and total production was revised to 49.45 million bushels. The 1997 barley planted and harvested acreage was also reduced 50,000 acres to 1,250,000 and 1,150,000, respectively. The yield remained unchanged at 53 bushels per acre and total production was revised to 60.95 million bushels. The 1996 and 1997 winter wheat yields were lowered by one bushel. The average yield for 1996 was revised to 31 bushels and total production was revised to 61.38 million bushels. The 1997 winter wheat average yield was revised to 38 bushels and production to 55.1 million bushels. The 1997 spring wheat planted and harvested acreage was reduced 100,000 acres to 4,250,000 acres and 4,100,000 acres, respectively. The yield remained unchanged at 29 bushels per acre and total production was revised to 118.9 million bushels. The 1997 durum wheat planted and harvested acreage was increased 10,000 acres to 300,000 acres and 290,000 acres, respectively. The yield remained unchanged at 26 bushels per acre and total production was revised to 7.54 million bushels.

Grain stock revisions for Montana were made only for barley. The September 1996 on farm barley stocks were reduced by 2 million to 40 million bushels. The December 1996 on farm barley stocks were also reduced by 2 million to 26 million bushels. This reduced both the September and December 1996 U.S. stocks by the same amount. No other revisions to Montana grain stocks were made.

For the U.S. all wheat production estimates for 1997 were revised down 1.8 percent and the 1996 production was revised down 0.3 percent. Changes in harvested acres and yields were made to both large and small states. The 1995 production was revised up slightly.

The U.S. barley acreage for 1996 was revised down 0.8 percent, and total production of 392.4 million bushels. The 1997 U.S. barley acreage estimates were revised down 3.9 percent, and a total production of 359.9 million bushels.

The June 1, 1998 U.S. on farm barley stocks were reduced by 1 million bushels to 43.7 million and the total U.S. stocks were reduced by 1 million bushels to119.233 million. The June 1,1998 all wheat stocks remained unchanged.

At the National level, all revisions to estimates of major crops (corn, soybeans, and all wheat) were less than 2 percent. Revisions were made in the 1993 through 1997 corn estimates. The 1997 production was revised down 1.7 percent with most of the decrease being attributed to the medium and smaller producing States. The 1996 and 1994 production estimates were revised down 0.7 percent and 0.5 percent, respectively. The 1995 production was revised up 0.4 percent. As was the case with 1997, most of the revisions were made in the smaller producing states. The 1993 production was revised up fractionally.

Montana Hog Inventory Up 6 Percent, U.S. Hog Inventory Up 2 Percent

The inventory of all hogs and pigs in Montana on December 1, 1998 was 190,000 head, a 6 percent increase from a year ago. Breeding stock was down 5 percent from December 1997 to 19,000 head. Market hog numbers increased to 171,000 head, up 7 percent from a year ago.

From December 1997 to December 1998, 38,500 sows farrowed in Montana. This was an increase of 7 percent from a year ago. The number of pigs saved per litter increased by 1 percent to 8.94 and resulted in a pig crop of 344,000 head, an 8 percent increase over last year. There were 650 farms with one or more hogs in Montana in 1998, unchanged from last year.

U.S. inventory of all hogs and pigs on December 1, 1998, was 62.2 million head. This was 2 percent above December 1997, but 2 percent below September 1, 1998. Breeding inventory, at 6.67 million head, was down 4 percent from December 1, 1997 and down 3 percent from September 1, 1998. Market hog inventory, at 55.5 million head, was 2 percent above last year, but 2 percent below last quarter.

The September-November 1998 U.S. pig crop, at 25.9 million head, was 2 percent more than 1997 and 11 percent more than 1996. Sows farrowing during this period totaled 2.99 million head, 2 percent above last year. The sows farrowed during this quarter represented 43 percent of the breeding herd. The average pigs per litter fell to an average of 8.65 pigs saved per litter for the September-November period, compared to 8.67 pigs last year. Pigs saved per litter by size of operation ranged from 7.20 for operations with 1-99 hogs to 8.90 for operations with more than 5,000 hogs and pigs.

U.S. hog producers intend to have 2.89 million sows farrow during the December 1998-February 1999 quarter, 1 percent below the actual farrowings during the same period in 1998, but 8 percent above 1997. Intended farrowings for March-May 1999, at 2.88 million sows, are 7 percent below the same period last year and 1 percent below 1997.

The number of hog operations with hogs totaled 114,380 during 1998, down 6 percent from last year and 20 percent below 1996. Places with 2,000 or more hogs on hand accounted for 6 percent of the operations and 64 percent of the inventory. This is the third time operations with inventories over 2,000 head have controlled over 50 percent of the total inventory. The number of operations with over 5,000 head of inventory, at 1,915, accounted for 42 percent of the total inventory. The total number of hogs under contract, owned by these over 5,000 head operations, but raised by contractees, accounted for 23 percent of the total U.S. hog inventory.

See table on back page.

"Season Greetings"

From all of us at Montana Agricultural Statistics Service! As 1998 comes to a close we should take a minute to look back on what has happened this year. Dry conditions and low prices during the fall of 1997 led winter wheat producers to plant the smallest winter wheat crop since 1941. Only 1.4 million acres of winter wheat were planted and 1.25 million acres were harvested.

In response to low prices, Montana producers seeded the smallest spring wheat acreage since 1994. Precipitation came at just the right time for spring wheat yields to average 30 bushels per acre. Montana farmers produced the third largest spring wheat crop on record behind 1995 and 1997 productions.

Montana durum wheat growers planted 450,000 acres and harvested 430,000 acres, both significantly higher than last year and the largest planted acreage since 1981. The average yield was 28.0 bushels per acre, 2 bushels more than last year. Total production was estimated at 12.04 million bushels, up nearly 65 percent from last year and the largest durum production since 1956.

The winter of 1997-1998 was very open for livestock producers. Temperatures were above normal and ranchers had excellent conditions for calving. Losses were minimal because of the warm, open winter.

As we look to 1999, Montana Agricultural Statistics Service will release the 1997 Census of Agriculture on February 1, 1999. The Census data is compiled every five years and is vital to Montana's agricultural industry. Census data will be used for many purposes such as developing agricultural policy, funding for agriculture, agricultural research, rural development planning and industry analysis for locating processing and manufacturing plants. Even those people working to implement the Governor's Vision 2005 Task Force for Agriculture will use Census data to help increase the value of Montana's agriculture.

To everyone involved in Montana's agriculture, thanks for your continued support. With your help, we can provide sound statistical facts that you can use to chart the future course of Montana's Number One Industry--Agriculture. We sincerely hope that you and your family have a joyous and safe holiday season. We hope 1999 will be a great year for Montana agriculture!

PLEASE RETURN

ERS Economist Says Beef Production Declining Cyclically

According to an economicst at Economic Research service, large female slaughter continues to point toward lower cattle inventories over the next couple of years. Although feedlot placements have been below year-earlier levels since midyear, on feed inventories remain well above average and fed cattle marketings will continue large through mid-winter with weights remaining seasonally heavy. However, the prospects of reduced beef production over the next 2 to 3 years and the recent concessional beef sales to Russia will help support prices during the transition to lower supplies. Profitability will return to the industry in 1999, but record pork and poultry supplies will hold down price gains.

Female Slaughter Remains Cyclically Large

Drought has affected female retention over the past couple of years, with large numbers of heifers again placed on feed this past spring and summer. Thus even as cattle inventories declined beef supplies increased. Beef cow and heifer slaughter remain large, reflecting continued poor forage prospects in most of the southern States. Although moisture conditions are much improved, pasture and hay prospects remain poor for the 1998/99 winter supplemental feeding period.

Total hay production in 1998 is essentially unchanged from a year earlier. Alfalfa hay production is expected to rise 4 percent from last year, but all other hays are forecast down 5 percent. Hay prices remain relatively high with reduced supplies available for sale in most areas as producers hold stocks to get their own cattle through the winter feeding season. Many producers simply cannot afford to risk buying expensive hay this winter if harsh winter conditions force heavier supplemental feeding.

Beef cow slaughter remains cyclically large. Third-quarter cow slaughter was nearly 1 percent above a year earlier, but down 16 percent from the large summer-quarter 1997 slaughter, and the second largest since 1987. Third-quarter heifer slaughter, while down 2 percent from 1997, was the second largest summer slaughter since 1988. Initial signs of herd expansion-- sharply reduced beef cow slaughter and increased heifer retention--are not going to begin until forage supplies are much improved and cattlemen are much more confident in future price directions. Forage improvement and higher returns are not likely to come together before next spring and summer.

Feeder Cattle Supplies Down

The supply of feeder cattle outside feedlots on October 1 was down 1 percent from a year earlier, but will tighten sharply over the next couple of years as calf crops decline and fewer heifers are available for feeding. Another disappointing wheat grazing year and poor forage supplies in general will cause feedlot placements to decline only 5 to 7 percent from a year earlier this fall and winter before dropping nearly 15 percent next spring and summer as the new grazing season begins.

Cyclical Production Declines Begin in 1999

Beef output in 1998 will be near record large, largely the result of dry conditions in much of the southern half of the country. This will be the largest production since 1976, when massive herd liquidation was beginning from the record 1975 cattle inventory of 132 million head. A slow pace of fed cattle marketings in second-half 1998 has resulted in larger numbers of heavy weight fed cattle being carried into 1999. This backlog of cattle will largely be cleaned up by mid-winter, beginning a fairly sharp dropoff in beef production over the next couple of years. Beef production is expected to be down about 5 percent from a year earlier in first-quarter 1999 and decline 7 to 8 percent during the remainder of the year. Beef production for all of 1999 is expected to decline 6 to 7 percent.

SOURCE for the above information: Livestock, Dairy and Poultry Situation and Outlook, ERS, November 18, 1998.

Agricultural Prices Received for October

The Montana winter wheat average price increased 48 cents from September 1998 to $3.03 per bushel, durum wheat increased 33 cents to $4.02 per bushel, and spring wheat increased 53 cents to $3.50 per bushel. The all wheat price for mid-November averaged $3.40 per bushel and the all barley price for mid-November was $2.16. October feed barley was up 5 cents per bushel to $1.31, but malt barley declined 22 cents to $2.64 per bushel. The price for alfalfa hay in mid-November, was $74.00 per ton, unchanged from last month. The mid-November other hay price of $64.00 increased $2.00 from October.

Livestock prices for the full month of October were mostly lower. Steer and heifer prices increased $4.60 to $69.30 per cwt. Cows were down $1.50 to $31.40 and the average price for calves decreased $1.00 to $75.80 per cwt. Sheep prices decreased 60 cents to $24.80 per cwt and lambs decreased $2.00 to $67.00 per cwt. Milk prices increased 40 cents from last month to $16.70 per cwt. Steer and heifer prices for mid-November averaged $71.80 per cwt.

Nationally, the all wheat price for mid-November, at $2.97 per bushel, was up 18 cents from the October entire month price. The mid-November all barley price was $2.01 per bushel, up 15 cents from October. Steer and heifer prices for mid-November were up 40 cents from October at $61.80 per cwt. Cow prices were $29.90 and all hog prices were $19.20 per cwt. Market egg prices were 61.0 cents per dozen.

The All Farm Products Index of Prices Received in November was 100 based on 1990-92=100, up 1 point (1.0 percent) from October. Price decreases from October for lettuce, hogs, broilers, and peanuts more than offset price increases for soybeans, milk, eggs, and wheat. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Higher seasonal marketings of cotton, milk, cattle, and cottonseed more than offset the relatively lower marketings of soybeans, peanuts, potatoes, and sunflowers. These marketing changes more than offset a decrease in prices and accounted for the one point increase in the overall index.

Compared with November 1997, the All Farm Products Index was 7 points (6.5 percent) lower. Price decreases from November 1997 for hogs, corn, soybeans, and lettuce more than offset price increases for milk, broilers, oranges, and tomatoes.

U.S. Cattle on Feed Down 2 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.76 million head on November 1, 1998. The inventory was 2 percent below November 1, 1997, but 7 percent above November 1, 1996.

Placements in feedlots during October totaled 2.83 million, 3 percent below 1997 and 6 percent below 1996. Net placements were 2.78 million. During October, placements of cattle and calves weighing less than 600 pounds were 776,000, 600-699 pounds were 649,000, 700-799 pounds were 685,000, and 800 pounds and greater were 719,000.

Marketings of fed cattle during October totaled 1.77 million, 2 percent below 1997 but 4 percent above 1996. **Other disappearance** totaled 52,000 during October, 43 percent below 1997 and 33 percent below 1996.

Cattle on Feed in Historic 7 States Down 2 Percent

Cattle on feed November 1, 1998, in the historic 7 States for feedlots with capacity [illegible],000 or more head totaled 9.20 million, down 2 percent from the previous year but 8 percent above November 1, 1996.

Placements in feedlots during October totaled 2.40 million, 2 percent below 1997 and 6 percent below 1996. **Marketings** during October totaled 1.53 million, 1 percent below 1997 but 7 percent above 1996. **Other disappearance** during October was 45,000 head, 42 percent below 1997 and 21 percent below 1996.

Montana and U.S. Red Meat Production Up for October

Montana slaughter plants produced 1.5 million pounds, dressed weight, of red meat during October 1998, up 1 percent from October 1997, and 13 percent above the previous month. Cattle slaughter totaled 1,800 head, unchanged from a year ago. The average live weight, at 1,133 pounds, was up 16 pounds from last year.

During October, there were 1,900 hogs slaughtered, 200 head more than last year. The average live weight, at 226 pounds, increased 4 pounds from a year ago. The number of sheep slaughtered came in at 300 head, 100 head less than last year. The average live weight decreased 2 pounds from a year ago to 123 pounds.

Commercial red meat production for the United States totaled 4.03 billion pounds in October, up 1 percent from the previous record high for October of 4.00 billion pounds produced in October 1997.

Beef production, at 2.23 billion pounds, was 3 percent below the previous year. Cattle slaughter totaled 3.05 million head, down 5 percent from 1997. The average live weight was up 19 pounds from the previous year, at 1,214 pounds.

Veal production totaled 21 million pounds, 25 percent below October a year ago and 5 percent below the previous record low for October set in 1993. Calf slaughter totaled 125 thousand head, down 11 percent from October 1997. The average live weight was 283 pounds.

Pork production totaled 1.76 billion pounds, up 6 percent from the previous record high for October set one year ago. Hog kill totaled 9.35 million head, 7 percent above 1997. The average live weight was unchanged from the previous year, at 257 pounds.

Lamb and mutton production, at 20 million pounds, was down 6 percent from the previous record low for October set last year.. Sheep slaughter totaled 323 thousand head, 4 percent below last year. The average live weight was 127 pounds, down 5 pounds from October a year ago.

January - October red meat production was 37.5 billion pounds, 4 percent above the comparable figure a year earlier. Accumulated beef production was 1 percent higher than last year, veal was down 23 percent, pork was up 10 percent, and lamb and mutton was down 3 percent.

October Milk Production Up 1.3 Percent

Milk production in the 20 major States during October totaled 11.1 billion pounds, up 1.3 percent from production in these same States in October 1997. September revised production, at 10.7 billion pounds was up 0.3 percent from September 1997.

Production per cow in the 20 major States averaged 1,436 pounds for October, 20 pounds above October 1997.

The number of cows on farms in the 20 major States was 7.75 million head, 3,000 head less than October 1997 and 2,000 head less than September 1998.

Montana Wage Rates Up 4 Percent, U.S. Up 2 Percent From A Year Ago

The average wage received by all hired agricultural workers in Montana during 1998 was $6.42 per hour compared with the $6.20 per hour received in 1997. Field workers increased their wages by $.22 per hour from last year to earn $6.43 per hour. Field and livestock workers combined wages increased $.29 per hour from a year ago to $6.20 per hour.

There were 1.25 million hired workers on the Nation's farms and ranches the week of October 11-17, 1998, down 3 percent from a year ago. Farm operators directly hired 983,000 workers. Agricultural service employees on farms and ranches made up the remaining 263,000 workers. Migrant workers accounted for 11.0 percent of the hired workforce compared to 11.2 percent last year.

Farm operators paid their hired workers an average wage of $7.60 per hour during the October 1998 survey week, up 29 cents from a year earlier. Field workers received an average of $7.15 per hour, up 21 cents from last October. Livestock workers earned $7.28 per hour compared with $6.80 a year earlier.

Crew leaders and custom crews provided 263,000 workers for the Nation's farms and ranches during the week of October 11-17, 1998. Service workers in California numbered 95,000 compared with 85,000 during the October 1997 survey week. Florida's number of service workers was 5,900 compared with 6,000 last year.

1/ Excludes Agricultural Service Workers. 2/ Annual rates are averages of the published wage rates for each survey week weighted by the number of hours worked during the week. The annual average for all States, Regions, and the U.S. is based on data collected for January. 3/ Excludes AK.

October Egg Production Up 2 Percent

U.S. egg production totaled 6.76 billion during October 1998, up 2 percent from the 6.65 billion produced in 1997. Production included 5.72 billion table eggs and 1.04 billion hatching eggs, of which 984 million were broiler-type and 60.0 million were egg-type. The total number of layers during October 1998 averaged 314 million, up 2 percent from the total average number of layers during October 1997. October egg production per 100 layers was 2,156 eggs, down one percent from 2,172 eggs in October 1997.

All layers in the U.S. on November 1, 1998, totaled 315 million, up 3 percent from a year ago. The 315 million layers consisted of 258 million layers producing table or commercial type eggs, 54.4 million layers producing broiler-type hatching eggs, and 2.53 million layers producing egg-type hatching eggs. Rate of lay per day on November 1, 1998, averaged 69.6 eggs per 100 layers, down 1 percent from the 70.4 a year ago.

Laying flocks in the 30 major egg production States produced 6.39 billion eggs during October, up 1 percent from October 1997. The average number of layers during October, at 296 million, was up 2 percent from a year earlier.

Getting That Year 2000 Bug

The Year 2000 problem could cause serious problems for commerce and communications all over the world if we're not serious about fixing it. Computer systems managers and programmers tried to save memory and money by representing the date with only two digits instead of four. So 1981 became 81 and 1998 just 98. The problem is that, when we reach the year 2000 some computers will recognize "double zero" not as 2000 but as 1900. This glitch could cause them to generate false data, possibly stop running.

This can affect all of us because our own computers or computerized systems may be at risk, and even if our own systems might be "year 2000 compliant" and therefore okay--our economy depends on the electronic processing and exchange of financial and other data. We might be affected by: inability of a stock market in another country to open; difficulties a bank may have in completing transactions;slowdowns in the railroads or in truck traffic due to malfunctioning signals; interruptions of power supply; food spoilage resulting from failure of computer-operated food storage or refrigeration systems; any number of other difficulties associated with failure of computerized systems to accurately process data.

In the Federal government alone we have more than 7,000 mission critical systems, carrying out everything from food stamps to food safety to air traffic control. It is a challenge to state and local governments, which use computers to run vital public health and safety systems from unemployment to water treatment. It is a challenge to virtually every American business, whether large or small. Everyone has a stake in this, and--though their own computer systems may be Y2K compliant--they need to do the following: (1) be sure that their systems are compliant. (2) take an inventory of all their data exchanges with outside partners--some may **not** be Y2K compliant. (3) develop an action plan.

We are especially concerned about rural communities and small businesses and the farms that they depend upon. We want to be sure that Rural America is Y2K compliant.

We have three suggestions for every farmer or small business owner: **1) Self-assessment.** Figure out if you have a Y2K problem. No farmer or small business owner should assume that he or she is home free on this issue. **2) Be informed.** Study the problem. Make realistic assessments based on what is central to your farm or company's operations. Don't be pushed into paying for remedies you don't need.

Logging on to various Internet Y2K sites is an excellent way to stay current. Sign up with an Internet Service Provider, and get online. There are several Y2K Internet sites on the World Wide Web, but I'll list two: (1) USDA's Cooperative State Research, Education, and Extension Service Website: http://www.reeusda.gov/y2k (2) The Small Business Administration has an excellent Website at http://www.sba.gov/y2k/

3) Act now. Fixing most Y2K problems is not particularly complicated. But it can be labor intensive and time consuming. The clock is ticking and we are all facing a deadline that truly cannot be moved.

Last minute fixes won't work. Businesses need time to test their systems to ensure that the "fix" they've installed is working. No one has the luxury of time in facing this problem. Y2K needs to be at the top, not the bottom, of their "To Do" list.

Crop Production Highlights
1998 Crop Year Summary
Ag Prices Received

November 1 Montana and U.S. Crop Production Highlights

Montana sugar beet production was forecast at 1.405 million tons on November 1, up 3 percent from last month's forecast and up 15 percent from last year. Forecasted yield, of 22.3 tons per acre, is up 0.7 tons per acre from last month and is 1.3 tons per acre higher than last year. Harvested acreage remains unchanged from last month at 63,000 acres, but is 4,700 acres higher than last year. As of November 1, 88 percent of the crop had been harvested which is 6 percent lower than the five-year average.

U.S. sugar beet production is forecast at 32.4 million tons, 9 percent above the 1997 final production estimate, and 3 percent above the October 1 estimate. If realized production would be the largest on record, exceeding the previous record of 31.9 million tons set in 1994. Acres to be harvested in the 12 sugar beet producing states was estimated at slightly less than 1.46 million acres, 2 percent above 1997, but 1,000 acres below the October estimate. Yield is estimated at 22.3 tons per acre, nearly 1.0 ton above October 1 and just 0.1 ton below the record set in 1981 and tied in 1987.

Montana fall potato production is forecast at 3.286 million hundredweight, down 1 percent from last year. Harvested acres are estimated at 10,600 acres, up 200 acres from last year. The yield is forecast at 310 cwt per acre, 10 cwt per acre lower than last year. As of November 1, ninety five percent of the crop has been harvested which is the same as the five-year average.

Nationally, fall potato production for 1998 is forecast at 429 million cwt, up 1 percent from last year, but 5 percent below 1996. Area harvested, at 1.22 million acres, is up 3 percent from last year, but 2 percent below 1996. The average yield is forecast at 352 cwt per acre, down 7 cwt from last year and 12 cwt below two years ago. Planting started on time this year and most States had good early weather. A hotter than normal summer caused rougher and smaller potatoes and lower yields in Western States. Harvest in the West was delayed as long as possible to gain more size. Central and Eastern States, on the other hand, had good size and yields. Total potato production from all four seasons is estimated at 471 million cwt in 1998, up 1 percent from last year, but 6 percent below the record large crop of 1996.

See crop production table on back page.

1998 Crop Year Summary

Low moisture conditions last fall caused Montana winter wheat producers to seed the smallest winter wheat crop since 1941. Winter wheat seeding totaled 1.4 million acres down 12 percent from last year's 1.6 million and 100,000 acres below 1995 when similar conditions existed. November was cool and dry. Precipitation was below normal for the Southwestern and Central regions of the state. For the month of December precipitation was below to much below average. Southern Montana received more moisture than other regions of the state but even in this region precipitation was only about 75 percent of normal. The Northeastern region received about nine percent of their average precipitation for December. With the dry conditions there were concerns about the lack of snow cover during the winter and as of December 31 eighty-seven percent of the seeded acreage had poor to very poor coverage.

During February snow finally fell on most of the state bringing much needed precipitation. Temperatures were above normal for the state during the month. March brought near normal temperatures and above normal precipitation for most portions of the state. During April most locations reported some precipitation and by the end of the month winter wheat was rated at only 50% good and 11% excellent. The planting of all crops was ahead of the five-year average. Spring wheat was 40 percent seeded as of April 26 and the five-year average for this date was 22 percent.

There was little precipitation the first ten days of May so seeding continued ahead of the average, and crop conditions were rated mostly fair. By the end of the month rainfall at most reporting stations was still below normal. The crop conditions by the end of the month were still reported mostly fair.

Crop conditions improved slightly during June with most stations reporting higher than normal rainfall by the end of the month. Yield prospects improved for the winter wheat crop during the month but as of June 28 only 35 percent of the crop was reported in good to excellent condition. Spring wheat and barley conditions were similar and oats was rated at 48 percent good to excellent. Progress for all crops was ahead of average normal at the end of the month.

Temperatures during July were mostly above normal and soil moisture conditions deteriorated. By the end of the month only 30 percent of the topsoil moisture was rated adequate and none surplus. The Northeast, Southeast, and South Central regions reported below normal precipitation by the end of the month. Winter wheat condition for the state improved slightly with yield expectations improving one bushel, to 37 bushels per acre, by the August 1 crop forecast. By the third of August 61 percent of the winter wheat crop was harvested compared to 14 percent for the five-year average. Progress of hay harvested was also ahead of normal by the end of the month.

Continued on next page.

PLEASE RETURN

1998 Crop Year Summary (continued from front page)

Most of the state received little precipitation during August. Harvest progress was ahead of normal for all the small grains by the end of the month about 98 percent of the winter wheat, 87 percent of the spring wheat, 88 percent of the barley, and 85 percent of the oats were harvested. The second cutting of alfalfa was 79 percent complete by August 30 compared with 68 percent for the average. Other hay was 96 percent complete compared with the average of 90 percent.

In September, Montana's 1998 winter wheat production was estimated at 48.75 million bushels, down 14% from 1997 and the lowest production since the severe drought of 1988. Low yields were not the problem in 1998, but rather a seeded acreage of 1.4 million acres which was the smallest since 1941. The 1998 average yield was 39 bushels per acre, which matched last year's average and was fourth highest on record. The yield was raised 2 bushels from the August forecast.

Spring wheat production was estimated at 108 million bushels, down 11% from last year, but the third largest crop on record only behind 1995 and 1997 production. The seeded acreage was 3.8 million acres, 550,000 acres less than 1997 and the smallest acreage seeded since 1994. Yields averaged 30 bushels per acre, up 1 bushel from 1997, but 1.4 bushels below the last five-year average which includes the exceptional yields produced in 1993 and 1995 in North Central Montana.

Montana durum wheat growers planted 450,000 acres and harvested 430,000 acres, both significantly higher than last year and the largest planted acreage since 1981. The average yield was 28.0 bushels per acre, 2 bushels more than last year. Total production was estimated at 12.04 million bushels, up nearly 65 percent from last year and the largest durum production since 1956.

The October 1 sugar beet production forecast was 1.36 million tons, up 11 percent from last year. Harvested acreage remained unchanged from September at 63,000 acres but this is 4,700 acres higher than last year. As of October 4 , 15 percent of the crop had been harvested which is 1 only percent lower than the five-year average. Total production of alfalfa hay was estimated at 3.45 million tons down 13 percent from last year due to a decrease in harvested acreage and lower yields. Harvested acreage is estimated at 1.50 million acres, down 150,000 acres from last year. Other hay yields remain unchanged from August at 1.7 tons per acre but are up 0.1 ton from 1997. Total production was set a 1.275 million tons, down 16 percent from last year. All hay production was estimated at 4.725 million tons, down 14 percent from last year.

By November 1 winter wheat seeding was nearly complete and sugar beets were slightly behind average and potato harvest was equal to the five-year average. Winter wheat condition was rated 1 percent very poor, 9 percent poor, 50 percent fair, 39 percent good, and 1 percent excellent. Topsoil moisture was rated at mostly adequate and subsoil moisture supplies were rated at only 45 percent adequate and 1 percent surplus.

The November 1 sugar beet production forecast is 1.405 million tons, up 3 percent from last month's forecast and up 15 percent from last year. Forecasted yield, at 22.3 tons per acre, is up 0.7 tons per acre from last month and is 1.3 tons per acre higher than last year. Harvested acreage remains unchanged from last month at 63,000 acres but this is 4,700 acres higher than last year. As of November 1, 88 percent of the crop had been harvested which is 6 percent lower than the five-year average.

Agricultural Prices Received for September

The average price for Montana winter wheat decreased 5 cents from August 1998 to $2.55 per bushel, durum wheat was down 50 cents to $3.69 per bushel, and spring wheat was 9 cents lower than August, at $2.97 per bushel. The all wheat price for mid-October averaged $3.23 per bushel and the all barley price for mid-October was $2.23. Feed barley is down 7 cents per bushel from August to $1.26 and malt barley declined 2 cents to $2.86 per bushel. The price for alfalfa hay in mid-October was $74.00 per ton, unchanged from last month. The mid-October other hay price, of $62.00, declined $3.00 from September.

Livestock prices for the full month of September were mostly lower. Steer and heifer prices decreased 90 cents to $64.70 per cwt. Cows were down $4.30 to $32.90 and the average price for calves increased 20 cents to $76.80 per cwt. Sheep prices decreased $3.10 to $25.40 per cwt and lambs decreased $10.40 cents to $69.00 per cwt. Milk prices increased $1.80 from last month to $16.30 per cwt. Steer and heifer prices for mid-October averaged $67.80 per cwt.

Nationally, the all wheat price for mid-October, at $2.72 per bushel, was up 31 cents from the September entire month price. The mid-October all barley price was $1.85 per bushel, down 16 cents from September. Steer and heifer prices for mid-October were up $2.60 from September at $61.50 per cwt. Cow prices were $30.70 and hog prices were $28.50 per cwt. Market egg prices were 53.2 cents per dozen.

The All Farm Products Index of Prices Received in October was 99 based on 1990-92=100, unchanged from September. Price increases from September for wheat, milk, tomatoes, and lettuce more than offset price decreases for potatoes, hogs, broilers, and peanuts. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower seasonal marketings of milk, wheat, tobacco, and grapes more than offset the relatively higher marketings of soybeans, corn, cotton, and cottonseed. These marketing changes completely offset the increase in prices.

Compared with October 1997, the All Farm Products Index was 8 points (7.5 percent) lower. Price decreases from October 1997 for soybeans, corn, hogs, and cattle more than offset price increases for milk, broilers, tomatoes, and onions.

UNITED STATES INDEX SUMMARY

September 1998 Small Grain Summary

Montana's 1998 **winter wheat** production was estimated at 48.75 million bushels, down 14% from 1997 and the lowest production since the severe drought of 1988. Low yields were not the problem in 1998, but rather a seeded acreage of 1.4 million acres which was the smallest since 1941. A dry fall in 1997 and economic considerations prompted the low acreage. Producers harvested 1.25 million acres, down 200,000 acres from the 1997 harvest. The 1998 average yield was 39 bushels per acre, which matched last year's average and was fourth highest on record. The yield was raised 2 bushels from the August forecast.

Spring wheat production was estimated at 108 million bushels, down 11% from last year, but the third largest crop on record only behind 1995 and 1997 production. The seeded acreage was 3.8 million acres, 550,000 acres less than1997 and the smallest acreage seeded since 1994. Producers chose not to plant re-crop acres and planted alternative crops when thought desirable. The crop was quickly seeded in 1998. Warm, dry weather prevailed through mid-May when nearly 95 percent of the acreage was seeded, a full 20 percentage points ahead of the five-year average. Much needed rain soon followed and got the wheat off to an excellent start. Producers harvested 3.6 million acres, 600,000 acres less than a year earlier. Yields averaged 30 bushels per acre, up 1 bushel from 1997, but 1.4 bushels below the five-year average which includes the exceptional yields produced in 1993 and 1995 in North Central Montana.

Montana **durum wheat** growers planted 450,000 acres and harvested 430,000 acres, both significantly higher than last year and the largest planted acreage since 1981. Favorable conditions got the crop planted earlier and timely precipitation allowed producers to obtain their highest yield in the last three years. The average yield was 28.0 bushels per acre, 2 bushels more than averaged in 1997. Total production was estimated at 12.04 million bushels, up nearly 65 percent from last year and the largest durum production since 1956.

Barley acreage in Montana increased for the first time in several years to1.4 million acres, 8 percent more than1997 and the largest planted acreage since 1991. Producers harvested 1.25 million acres, 50,000 acres more than were harvested for grain in 1997. Yields averaged 48 bushels per acre, down 5 bushels from last year and down 4 bushels from our previous forecast. Production was estimated at 60.0 million bushels, down 6 percent from last year.

Oat production was estimated at 3.24 million bushels, down 16 percent from last year. Planted acreage was estimated at 140,000 acres, the same as a year earlier. Harvested acreage was set at 60,000 acres, down 10,000 from 1997. Yields averaged 54 bushels per acre, one bushel below last year.

Nationally, the 1998 **winter wheat** crop production was estimated at 1.89 billion bushels. This is down 1 percent from the August forecast, but fractionally higher than the 1997 level. The U.S. yield dropped a tenth from August to 46.9 bushels per acre, but is still a new record high average, nearly two bushels better than last year's former record. Acreage for grain was estimated at 40.2 million acres, down 1 and 4 percent from last month and last year, respectively. Almost all the net change in grain area comes from Colorado, Oklahoma, and Texas drops.

Other Spring Wheat production in 1998 was estimated at 529 million bushels, up 2 percent from the last forecast, but 5 percent less than in 1997. An increase in area fostered the production change. Harvested area is now 15.2 million acres, down 19 percent from last year. The U.S. yield was 34.9 bushels per acre, equaling last forecast and 5.0 bushels better than in 1997.

Durum wheat production for 1998 totaled 141 million bushels, up 7 percent from September 1 and 64 percent better than last year. This is the biggest Durum crop since 1982. Grain area now totals 3.73 million acres, up 20 percent from last year. The U.S. yield was placed at 37.8 bushels per acre, up a bushel from the last forecast to the second highest on record.

U.S. **Barley** production in 1998 was estimated at 358 million bushels, down 4 percent from last year's estimate. Average yield per acre, at 59.9 bushels, was up 1.6 bushels from 1997. The area harvested for grain was estimated at 5.98 million acres, 7 percent less than a year ago. Production was 4 percent below the September 1 forecast. Area harvested decreased 2 percent from the previous forecast, and the average yield per acre declined 1.4 bushel.

Oat production for the 1998 crop year was estimated at 169.9 million bushels, 4 percent below the August 1 forecast, and 3 percent smaller than the 1997 production. This is the third smallest crop since records were first kept in 1866, exceeding the 1995 production by 5 percent and the 1996 production by 9 percent. The forecasted yield, at 60.5 bushels per acre, is up 0.1 bushels from the August forecast and equal to last year. Area harvested and to be harvested for grain in 1998 is 2.81 million acres, 4 percent below the previous month and 3 percent below 1997. If realized, this would be the second smallest acreage harvested for grain on record, exceeding only the 1996 harvested acreage.

The Montana crop acreage and grain stocks estimates in this issue of the Reporter are the result of surveying approximately 1,400 Montana farmers and ranchers during September. Names were selected on a statistical probability basis. SPECIAL THANKS to those operators that were interviewed and responded to the survey. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics.

September 1, 1998 Grain Stocks

Montana **all wheat** stocks were estimated at 200.0 million bushels on September 1, 1998, up 6 percent from stock levels at this time a year ago. Disappearance since June 1, 1998 totaled 35.79 million bushels, up 9 percent from the disappearance level for this period last year. **Winter wheat** stocks were estimated at 65.6 million bushels, up 21 percent from last year. **All spring wheat** stocks were estimated at 134.4 million bushels compared with135.0 bushels a year ago. **Durum wheat** stocks totaled 10.8 million bushels, up from 6.5 million bushels the previous year.

Montana **barley** stocks on September 1 were estimated at 50.3 million bushels, down 7 percent from September 1,1997. **Oat** stocks, at 3.19 million bushels, are 19 percent less than last September 1.

All wheat in all storage positions in the U.S. on September 1, 1998 is estimated at 2.38 billion bushels, up 15 percent from September 1, 1997 and the highest September 1 level since 1990. Farm stocks total 886 million bushels and off- farm stocks are 1.50 billion bushels. The on-farm total is up 12 percent from a year ago and the off-farm level is up 17 percent. Off-farm wheat stocks are at the largest September 1 total since 1987. All wheat disappearance for the first quarter of the 1998-99 marketing year is an apparent 899 million bushels, up 1 percent from the same period a year ago.

Durum wheat stored in all positions on September 1, 1998 totaled 125 million bushels, up 43 percent from last September. This is the largest first quarter inventory since 1991. On farm stocks, at 88.0 million bushels, are up 58 percent from last year. Disappearance from all positions is 42.0 million bushels, up 44 percent from June-August 1997.

Barley stocks in all positions on September 1, 1998 are estimated at 327 million bushels, slightly below the stocks of September 1, 1997. Of the total barley stocks on hand, 195 million bushels are stored on farms, 1 percent below a year ago. September 1, 1998 off-farm stocks are 1 percent above last year at 132 million bushels. Indicated disappearance during the June-August quarter totaled 151 million bushels, 3 percent below the same period a year earlier.

Oats stored in all positions on September 1, 1998 totaled nearly 162 million bushels, 3 percent above the stocks on September 1, 1997. Of the total stocks on hand, 110 million bushels were stored on farm, 2 percent above this quarter last year. Off-farm stocks totaled 51.5 million bushels, 5 percent above a year earlier. Indicated disappearance from all positions during the June-August quarter totaled 82.2 million bushels, 4 percent less than the same period a year ago.

Old crop **corn** stored in all positions on September 1, 1998 is estimated at 1.31 billion bushels, up 48 percent from September 1, 1997. This is more than 3 times the corn stored on September 1, 1996, which was the lowest stocks on record since 1976.

Agricultural Prices Received for August

Prices Montana farmers received for their crops in August were once again below the previous month. The August winter wheat average price of $2.60 per bushel dropped 34 cents from July 1998, spring wheat was down 26 cents to $3.06 per bushel, but durum wheat, the only crop to show improvement, was up 10 cents to $4.19 per bushel. The August all wheat price of $2.91 is the lowest average price since October 1991. August feed barley averaged $1.33 per bushel, 35 cents below last month's average, and malt barley is down 27 cents to $2.88 per bushel. The all barley average price for August, at $2.45, is 24 cents below July, but is above average price received in May and June of 1998. The mid-September price for alfalfa hay was $74.00 per ton, down $3.00 per ton from the August average. The mid-September other hay price was $65.00, two dollars less than last month. The all wheat price for mid-September averaged $2.84 per bushel and the all barley price for mid-September was $1.78.

Livestock prices for the full month of August were generally lower. Calves weighing less than 500 pounds were higher than last month. Steer and heifer prices decreased $3.80 to $65.60 per cwt. Cows were down 40 cents to $37.20, but the average price for calves were up $1.80 to $76.60 per cwt. Sheep prices declined to $28.50 per cwt, $1.40 lower than July, and lamb prices fell $1.40 to $79.40 per cwt. Sheep and lamb prices are significantly lower than August 1997 when sheep averaged $40.50 and lambs were bringing $98.80. Milk prices are up sharply at $14.50 per cwt, $1.50 above last month and $2.20 higher than August 1997. Steer and heifer prices for mid-September averaged $64.00 per cwt.

Nationally, the September all wheat price, at $2.37 per bushel, was down 2 cents from August and $1.29 below September 1997. This is the lowest monthly all wheat price since August 1987. The mid-September all barley price was $1.79, down sharply from $2.06 received in August. September U.S. beef cattle price of $55.80 was down $1.60 from last month and $7.80 below September 1997. The August average price received for cows was $34.20. The September hog price was $29.40 per cwt, down $5.70 from August and $21.00 below a year ago. The August price for eggs was $.649 per dozen and the mid-September price was $.634.

The All Farm Products Index of Prices Received in September was 98 based on 1990-92=100, down 3 points (3.0 percent) from August. Price decreases from August for hogs, cattle, corn, and grapes more than offset price increases for milk, tobacco, tomatoes, and apples. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower seasonal marketings of cattle, broilers, wheat, and grapes more than offset the relatively higher marketings of soybeans, peanuts, corn, and cotton. These changes contributed one point of the three point decline in the overall index. Compared with September 1997, the All Farm Products Index was 9 points (8.4 percent) lower. Price decreases from September 1997 for hogs, corn, cattle, and wheat more than offset price increases for milk, broilers, grapes, and onions.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Aug. 1997	Sept. 1997	Aug. 1998	Sept. 1998

August Red Meat Production

Montana slaughter plants produced 1.5 million pounds, dressed weight, of red meat during August 1998, down 4 percent from August 1997, but up 21 percent from last month. Cattle slaughter totaled 1,700 head, down100 head from a year ago. The average live weight was 1,111 pounds, 5 pounds lighter than last August.

There were 2,300 hogs slaughtered during August, 300 more than in August 1997. The average live weight was 223 pounds, up 3 pounds from a year earlier. Sheep slaughtered were up 100 head from last August and totaled 500 head. The average live weight increased 7 pounds from last August to 125 pounds.

Commercial red meat production for the United States totaled 3.77 billion pounds in August, up 4 percent from the 3.62 billion pounds produced in August 1997. Beef production, at 2.23 billion pounds, was slightly above the previous year. January - August red meat production was 29.6 billion pounds, 4 percent above the comparable figure a year earlier. Accumulated beef production was 1 percent higher than last year, veal was down 23 percent, pork was up 11 percent, and lamb and mutton was down 3 percent.

Cattle slaughter totaled 3.04 million head, down 2 percent from 1997. The average live weight was up 22 pounds from the previous year, at 1,209 pounds. Veal production totaled 20.0 million pounds, 21 percent below August a year ago and 9 percent below the previous record low for August set in 1991. Calf slaughter totaled 125 thousand head, down slightly from August 1997. The average live weight was 266 pounds.

Pork production totaled 1.50 billion pounds, up 11 percent from the previous year and just above the previous record high for August set in 1995. Hog kill totaled 8.17 million head, 11 percent above 1997. The average live weight was 1 pound above the previous year, at 252 pounds. Lamb and mutton production, at 17.0 million pounds, was down 11 percent from the previous record low for August set in 1997. Sheep slaughter totaled 275 thousand head, 9 percent below last year. The average live weight was 123 pounds, down 4 pounds from August a year ago.

U.S. Cattle on Feed Down 1 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.02 million head on September 1, 1998. The inventory was 1 percent below September 1, 1997 but 15 percent above September 1, 1996.

Placements in feedlots during August totaled 2.03 million, 16 percent below 1997 and 10 percent below 1996. Net placements were 1.98 million. During August, placements of cattle and calves weighing less than 600 pounds were 378,000, 600-699 pounds were 406,000, 700-799 pounds were 630,000, and 800 pounds and greater were 617,000.

Marketings of fed cattle during August totaled 1.94 million, 4 percent below 1997 but 1 percent above 1996. The year-to-year relationship between fed cattle marketings and commercial slaughter was affected by an increase in cattle imported from Canada that are going directly to slaughter. Other disappearance totaled 52,000 during August, 16 percent above 1997 and 4 percent above 1996.

Cattle on Feed in Historic 7 States Down 1 Percent

Cattle on feed September 1, 1998, in the historic 7 States for feedlots with capacity of 1,000 or more head totaled 7.75 million, down 1 percent from the previous year but 17 percent above September 1, 1996. Placements in feedlots during August totaled 1.75 million, 17 percent below 1997 and 11 percent below 1996. Marketings during August totaled 1.67 million, 5 percent below 1997 but 1 percent above 1996. Other disappearance during August was 42,000 head, the same as 1997 but 14 percent above 1996.

U.S. August Milk Production Down 0.4 Percent

Milk production in the 20 major States during August totaled 11.2 billion pounds, down 0.4 percent from production in these same States in August 1997. July revised production, at 11.3 billion pounds was down 0.8 percent from July 1997.

Production per cow in the 20 major States averaged 1,441 pounds for August, 5 pounds below August 1997. The number of cows on farms in the 20 major States was 7.75 million head, 6,000 head less than August 1997 but 1,000 head more than July 1998.

PLEASE RETURN

August Egg Production Up 3 Percent

U.S. egg production totaled 6.67 billion during August 1998, up 3 percent from the 6.48 billion produced in 1997. Production included 5.64 billion table eggs and 1.04 billion hatching eggs, of which 979 million were broiler-type and 58.0 million were egg-type. The total number of layers during August 1998 averaged 308 million, up 3 percent from the total average number of layers during August 1997. August egg production per 100 layers was 2,162 eggs, down slightly from 2,165 eggs in August 1997.

All layers in the U.S. on September 1, 1998, totaled 309 million, up 3 percent from a year ago. The 309 million layers consisted of 252 million layers producing table or commercial type eggs, 54.3 million layers producing broiler-type hatching eggs, and 2.54 million layers producing egg-type hatching eggs. Rate of lay per day on September 1, 1998, averaged 69.3 eggs per 100 layers, down 1 percent from the 70.0 a year ago.

Laying flocks in the 30 major egg production States produced 6.30 billion eggs during August, up 2 percent from August 1997. The average number of layers during August, at 291 million, was up 2 percent from a year earlier.

September 1 U.S. Hog and Pig Inventory

U.S. inventory of all hogs and pigs on September 1, 1998, was 62.9 million head. This was 3 percent above September 1997, and 2 percent above June 1, 1998. Breeding inventory, at 6.94 million head, was down slightly from September 1, 1997 and down 1 percent from June 1, 1998. Market hog inventory, at 56.0 million head, was 3 percent above last year and 2 percent above last quarter.

The June-August 1998 U.S. pig crop, at 26.3 million head, was 2 percent more than 1997 and 11 percent more than 1996. Sows farrowing during this period totaled 3.02 million head, 2 percent above last year. The sows farrowed during this quarter represented 43 percent of the breeding herd. The average pigs per litter fell to an average of 8.70 pigs saved per litter for the June-August period, compared with 8.72 pigs last year. Pigs saved per litter by size of operation ranged from 7.30 for operations with 1-99 hogs to 8.90 for operations with more than 5,000 hogs and pigs.

U.S. hog producers intend to have 2.99 million sows farrow during the September-November 1998 quarter, 2 percent above the actual farrowings during the same period in 1997 and 10 percent above 1996. Intended farrowings for December 1998-February 1999, at 3.00 million sows, are 3 percent above the same period last year and 11 percent above 1997.

1997 Potato Production and Disposition

Montana's 1997 potato production totaled 3.33 million cwt, 4 percent above last year and 13 percent higher than 1995. Producers harvested 10,400 acres, 200 more than a year ago and 600 acres more than two years ago. Potato yields averaged 320 cwt per acre compared with 315 cwt in 1996.

Value of production from the 1997 crop was 23.5 million, up 11 percent from 1996. The average price was $7.05 per cwt, up 45 cents from the previous year's crop. Sales of Montana's 1997 potato crop totaled $20.9 million which is 11 percent higher from last year's crop. Producers sold 3.0 million cwt from the 1997 crop compared with 2.9 million cwt a year ago.

Total 1997 potato production is estimated at 466 million cwt, down 7 percent from 1996, but 5 percent above 1995. Harvested area, at 1.35 million acres, was down 6 percent from 1996 and 2 percent below 1995. The average yield of 346 cwt per acre was down 4 cwt from 1996, but 23 cwt above 1995. In 1997, all seasonal groups had production below the previous year: Winter fell 5 percent; spring decreased 3 percent; summer dropped 8 percent; and fall potatoes declined 7 percent. This is the third largest total potato production in the United States.

Summer potato production was revised to 17.9 million cwt for 1997, down 8 percent from 1996 and less than 1 percent below 1995. Harvested area of 65,900 acres fell 12 percent from 1996, while the average yield of 271 cwt per acre gained 10 cwt from a year earlier. The revised production estimate places the summer potato crop 9 percent above the July 1997 forecast.

Fall potatoes were finalized at 423 million cwt, down 7 percent from 1996, but 5 percent above 1995. This is the second largest production of fall potatoes in the United States, exceeded only by the record large crop of 1996. Area harvested in 1997 was estimated at 1.18 million acres, down 6 percent from 1996 and 3 percent below two years ago. The average yield, at 359 cwt per acre, was down 5 cwt from 1996. Final production of fall potatoes was 1 percent above the first forecast made in November 1997.

Value of all potato production was estimated at $2.60 billion, up 7 percent from last year, but 13 percent below the record high value in 1995. The average price, at $5.62 per cwt, gained 70 cents from a year earlier, but was $1.15 short of 1995.

Sales from the 1997 potato crop totaled 428 million cwt, down 5 percent from 1996, but 5 percent above 1995. Non sales accounted for 37.4 million cwt of 1997 potatoes, down 21 percent from 1996, but 7 percent above 1995. Over the past five years, an average of 90.7 percent of the potatoes produced have been sold. The other 9.3 percent were either lost (shrinkage and loss) or used for seed, home use, and livestock feed on farms where grown. In the 1997 season, farmers sold 91.9 percent of their crop and kept or lost 8.1 percent.

Processors used 268 million cwt of raw potatoes from the 1997 crop, down 5 percent from 1996, but 5 percent above 1995. Table stock sales totaled 131 million cwt, less than 1 percent below last year. Seed sales of 25.4 million cwt were up 5 percent. Sales for livestock feed, at 3.60 million cwt, backed off sharply from the 1996 diversion program, but were 12 percent above 1995.

Chip potato use totaled 48.1 million cwt, slightly below a year earlier. Freezers took 165 million cwt of raw potatoes, down 5 percent, while dehydrating claimed 48.4 million cwt, down 11 percent. Canning use, at 5.50 million cwt, gained 10 percent. Starch, flour and other products were made from 1.31 million cwt of potatoes, a drop of 33 percent from last year.

Shrinkage and loss was estimated at 32.2 million cwt, down 22 percent from last year, but 9 percent above 1995. Livestock feed and home use totaled 1.33 million cwt, down 7 percent. Growers kept an additional 4.14 million cwt for seed on their own farms, down 14 percent from last year.

- Wheat & Barley Movement

September 1, 1998 Crop Production Forecast

Montana's other spring wheat production forecast is unchanged from last month. The production forecast as of September 1, is 105.0 million bushels. If realized this would be 14 percent lower than last year. The average yield, at 30 bushels per acre, remained unchanged from the August 1 forecast and is 1 bushel per acre higher than last year. Harvested acres are also unchanged from last month and are forecast at 3.5 million acres which is 300,000 acres less than last year. With [illegible] harvest conditions, harvest is progressing well ahead of average with 95 percent harvested as of September 6 while the average is 72 percent.

Durum wheat production is also unchanged from last month at 11.4 million bushels, up 57 percent from last year. Yields are expected to average 26 bushels per acre which is the same as last month and last year. Harvested acreage increased from 280,000 acres last year to 440,000 acres this year.

Even though winter wheat production is not forecast on September 1, by adding the August winter wheat production forecast with current spring wheat and durum forecasts the total wheat crop would be estimated at 162.69 million bushels, down 12 percent from last year.

Barley production remains unchanged from last month and is forecast at 67.6 million bushels, up 6 percent from last year. Yields are forecast at 52 bushels per acre compared with 53 bushels per acre last year. Harvested acreage is up 100,000 from last year and is forecast at 1.3 million acres.

[illegible]gar beet yield remain unchanged from last month, at 21.6 tons per acre, but harvested acreage was adjusted up to 63,000 acres from last month's 60,200 acres. Total production is forecast at 1.3 million tons, up 6 percent from last year.

At the **U.S.** level all wheat production is placed at 2.56 billion bushels, up 1 percent from the August forecast and up 2 percent from 1997. The U.S. yield is forecast at 43.3 bushels per acre. This is up 0.3 bushels from last month and is a new record high yield. Other spring wheat production is forecast at 519 million bushels, up 2 percent from last month, but down 7 percent from last season. The final forecast of U.S. average yield is 34.9 bushels per acre. This is 0.7 bushels per acre better than a month ago. There were no area changes. Hard Red Spring production is up 2 percent from August at 467 million bushels. White Spring production is down about 2 percent. Minnesota growers have harvested a better yielding crop than previously expected. Both the Montana and North Dakota crops are nearing harvest completion. The South Dakota harvest is finished.

U.S. durum wheat production is forecast at 132 million bushels, up 4 percent from last month and 53 percent more than in 1997. This is the biggest durum crop since 1982. The U.S. yield is now forecast at 36.8 bushels per acre, up 1.6 from last month and second only to the record high set in 1992. Area for harvest is unchanged from the last forecast at 3.58 million acres. As of September 6, 83 percent of North Dakota's crop was harvested. This is about 3 weeks ahead of average.

U.S. barley production for 1998 is forecast at 372 million bushels, down slightly from both August 1998 and the 1997 final production. Yields are expected to average 61.3 bushels per acre, a decrease of 0.3 bushels from August, but still 3.0 bushels higher than last year. Area harvested and to be harvested, at 6.08 million acres, remained unchanged from August but is 5 percent below the 6.43 million acres harvested in 1997.

Planted acres for sugar beets were updated from the August crop report in Montana and North Dakota. Acres to be harvested in the 12 sugar beet-producing states were forecasted at just under 1.46 million acres, 27,200 acres above 1997, but 5,300 acres below the previous forecast. Heavy rains drowned several thousand acres in the southern Red River Valley of North Dakota and Minnesota and accounts for most of the increase in abandonment.

U.S. corn grain production is forecast at 9.74 billion bushels, up 2 percent from last month and up 4 percent from 1997. Based on September 1 conditions, yields are expected to average 132.0 bushels per acre, up 2.0 bushels from last month and up 5 bushels from a year ago. If realized, this would be the second largest production and the second highest yield on record. Acreage for harvest is estimated at 73.8 million acres, unchanged from last month and virtually unchanged from 1997.

See tables on following page.

1998 United States Cash Rents Generally Higher, Montana Slightly Lower

Cash rents for agricultural cropland were mixed with most States showing increases while other States held at the same level or dropped slightly. Cropland cash rent estimates were made for 40 States. California again had the highest cash rent for irrigated land at $235 per acre. The major corn producing States of Iowa, Illinois, and Nebraska all had cropland rents exceeding $100 per acre. Western States showing Irrigated cropland over $100 per acre, included Arizona, Idaho, Oregon, and Washington. The average rent for irrigated cropland in Montana was $51.80 per acre, while non-irrigated rents averaged $16.50 per acre down 50 cents from 1997. States in the Corn Belt and Appalachian regions showed little to no change from last year with percentage changes that ranged from a 2.9 percent decrease to a 3.6 percent increase.

Pasture cash rents for 1998 increased from the previous year for most of the 25 States estimated. Illinois, Pennsylvania, and Iowa had the highest pasture rents at $42, $37, and $35 respectively. States with the lowest cash rents included Oklahoma, Texas, Colorado, Montana, and New Mexico all with rents under $8 per acre. Pasture rents in Montana averaged $4.00 per acre, down $1.00 from 1997.

1/ Estimates for current month carried forward from an earlier forecast.

Agricultural Prices Received for June

The Montana winter wheat average price decreased 25 cents from May 1998 to $2.81 per bushel, durum wheat dropped 47 cents to $4.30 per bushel, and spring wheat was down 14 cents to 3.41 per bushel. Feed barley increased 14 cents per bushel to $2.06, and malt barley decreased 2 cents to $2.75 per bushel. The price for alfalfa hay in July, was $80.00 per ton, up $4.00 per ton from last month. The July other hay price of $68.00 is unchanged from June. The all wheat price for mid-July averaged $3.21 per bushel and the all barley price for mid-July was $2.45.

With the exception of lambs, livestock prices for the full month of June were below May prices. Steer and heifer prices decreased $4.40 to $71.50 per cwt. Cows were down 10 cents to $37.10 and the average price for calves fell $7.30 to $79.70 per cwt. Sheep prices decreased 10 cents to $26.60 per cwt, but lambs increased $18.70 to $89.70 per cwt. Milk prices decreased 40 cents from last month to $13.40 per cwt. Steer and heifer prices for mid-July averaged $71.70 per cwt.

Nationally, the all wheat price for June, at $2.77 per bushel, was down 29 cents from May. The all barley price also decreased to $1.95 per bushel. Steer and heifer prices were down at $64.50 per cwt. Cow prices were $36.10 and hog prices were $42.20 per cwt. Egg prices were 60 cents per dozen.

The All Farm Products Index of Prices Received in July was 102 based on 1990-92=100, unchanged from June. Price increases from June for broilers, tomatoes, lettuce, and milk offset price decreases for cattle, hogs, wheat, and corn. The seasonal changes in the mix of commodities farmers sell also affect the overall index level; however, these changes were essentially offsetting in July.

Compared with July 1997, the All Farm Products Index was 5 points (4.7 percent) lower. Price decreases from July 1997 for hogs, wheat, cattle, and soybeans more than offset price increases for milk, tomatoes, broilers, and peaches.

Wheat & Barley Movement 6% Lower Than Last Year

Wheat shipped to out-of-state destinations during the December 1997-May 1998 period, at 67.8 million bushels, was 6% lower than the same period a year ago. Ninety percent of wheat shipped during this period headed west, totaling 61 million bushels, down 9% from a year earlier. Movements to eastern destinations more than doubled for this period, totaling 3.4 million bushels. Other destinations, mostly to the south, received 3.5 million bushels up 6% from last year.

Montana barley shipped to out-of-state destinations, December 1997-May 1998, was 14.3 million bushels, up 25% from the same period last year. Fifty-two percent of barley shipped out of Montana headed for destinations other than the west coast. Shipments to western destinations were up slightly from the same period last year, at 6.9 million bushels. Eastern destination shipments totaled 5.9 million bushels up 42% from last year. Shipments to other destinations were up from last year's at 0.4 million bushels to 1.5 million bushels this year.

Spring and Winter Wheat Production Forecast Higher

Montana producers expect to harvest 46.25 million bushels of winter wheat. Expected yields are up 1 bushel per acre from last month to 37 bushels per acre. If realized, total production would be down over 18 percent from last year due to reduced harvested acreage and yield. Hot, dry weather has prompted an early harvest and 67 percent of the crop combined by August 9 compared to a 5-year average of 33 percent harvested.

Other spring wheat production is forecast at 105.0 million bushels with a yield of 30 bushels per acre. If realized, the yield would be 1 bushel per acre above last year, but total production would be 14 percent below 1997. As of August 9 harvest is 14 percent complete compared to 4 percent for the average with 43 percent of the crop rated good to excellent and 40 percent rated in fair condition.

The durum wheat estimate increased 1 bushel from last month to 26 bushels per acre with expected production of 11.4 million bushels. This is the largest production since 1981 and up 57 percent from last year.

Barley producers are also expecting a slightly larger crop with yields expected to be 52 bushels per acre, up 2 bushels from last month. Total production is expected to be 97.6 million bushels, up 4 percent from last month and up 6 percent from last year. Oat production is forecast at 4.8 million bushels, up 7 percent from last month and up 25 percent from last year. The yield is up 4 bushels per acre from last month and up 5 bushels from last year. Harvested acreage is up 10,000 acres from 1997 to 80,000 acres.

At 2.2 tons per acre, Montana hay producers are expecting lower alfalfa yields than last year, while expected yields for other hay at 1.7 tons per acre are higher than last year. Both types of hay are expected to have lower harvested acres than last year. Total production is forecast at 4.6 million tons compared with 5.5 million tons last year.

Montana corn production is estimated at 1.95 million bushels, up 3 percent from last year. Yields are expected to average 130 bushels per acre, down 5 bushels from last year. Forecasted dry bean yield is set at 2,200 pounds per acre with total production set at 264,000 cwt, up 3 percent from last year. Sugar beet production is forecast at 1.3 million tons, up 6 percent from last year.

At the U.S. level, all wheat production is placed at 2.55 billion bushels, up 1 percent from both the July forecast and 1997. Based on August 1 conditions, the U.S. yield is forecast at 43.0 bushels per acre. This is up 0.4 bushels from last month and is a new record high yield. The final winter wheat production forecast is 1.91 billion bushels, up 1 percent from last month and 2 percent higher than 1997. The U.S. yield is forecast at a record high 47.0 bushels per acre, up 0.4 bushels from July 1. Grain area was not changed from last month.

Durum wheat production is forecast at 126 million bushels, up less than 1 percent from last month and 46 percent more than 1997. The U.S. yield is now forecast at 35.2 bushels per acre, up a tenth of a bushel per acre from July 1.

Other spring wheat production is forecast at 508 million bushels, up 2 percent from July 1. Based on August 1 conditions, the U.S. yield is forecast at 34.2 bushels per acre. This is 0.7 bushels per acre better than a month ago. There were no area changes. Hard Red Spring production is up 2 percent from July at 456 million bushels. White Spring production is up less than 1 percent.

U.S. barley production for 1998 is forecast at 374 million bushels, down only fractionally from both July 1998 and from 1997 final production. Yields are expected to average 61.6 bushels per acre, a decrease of 0.3 bushels from July but still 3.3 bushels higher than last year. Yield changes from the July forecast were made in eight States. Area harvested and to be harvested, at 6.08 million acres, remained unchanged from July, but is 5 percent below the 6.43 million acres harvested in 1997.

Production of dry edible beans is forecast at 29.9 million cwt for 1998, up 3 percent from a year earlier and 7 percent above two years ago. Harvested acres, at 1.90 million acres, are expected to be the highest since 1991's 1.91 million acres, but average yields are 125 pounds per acre below last year.

All hay production for 1998 is forecast at 148 million tons, down 3 percent from 1997 and down 1 percent from 1996. All hay yields are forecasted at 2.48 tons per acre, down slightly from last year. Acreage for harvest of alfalfa and alfalfa mixtures and other hay is unchanged from June at 59.8 million acres which is down 2 percent from 1997.

May Ag Prices Received Mostly Mixed

The Montana winter wheat average price decreased 22 cents from April 1998 to $3.06 per bushel, durum wheat was down 10 cents to $4.77 per bushel, and spring wheat was unchanged at $3.55 per bushel. The all wheat price for mid-June averaged $3.24 per bushel and the all barley price for mid-June was $2.26. Feed barley is down 4 cents per bushel to $1.92, but malt barley increased 3 cents to $2.77 per bushel. The price for alfalfa hay in May, was $71.00 per ton, unchanged from last month. The May other hay price of $61.00 rose $1.00 from April.

With the exception of lambs, livestock prices for the full month of May were below April prices. Steer and heifer prices decreased $3.10 to $75.90 per cwt. Cows were down $2.70 to $37.20 and the average price for calves fell $1.90 to $87.00 per cwt. Sheep prices decreased $8.40 to $26.70 per cwt, but lambs increased 70 cents to $71.00 per cwt. Milk prices decreased 70 cents from last month to $13.80 per cwt. Steer and heifer prices for mid-June averaged $70.20 per cwt.

Nationally, the all wheat price for May at $3.06 per bushel, was down 9 cents from April. The all barley price was unchanged at $2.14 per bushel. Steer and heifer prices were the same at $66.30 per cwt. Cow prices were $36.40 and hog prices were $42.20 per cwt. Egg prices were 54.8 cents per dozen.

The All Farm Products Index of Prices Received in June was 101 based on 1990-92=100, down 2 points (1.9 percent) from May. Price decreases from May for cantaloupes, lettuce, corn, and tomatoes more than offset price increases for broilers, milk, oranges, and eggs. The seasonal changes in the mix of commodities farmers sell also affect the overall index level; however, these changes were essentially offsetting in June.

Compared with June 1997, the All Farm Products Index was 6 points (5.6 percent) lower. Price decreases from June 1997 for wheat, hogs, soybeans, and corn more than offset price increases for milk, broilers, potatoes, and peaches.

United States Index Summary

INDEX 1990-92=100	May 1997	June 1997	May 1998	June 1998
Prices Received	108	107	103	101

Production Expenditures Up More than 3 Percent in 1997

U.S. farm production expenditures totaled $181.1 billion in 1997, up 3.5 percent from the revised 1996 total of $175.0 billion. The largest contributors to the increase were: livestock purchases, up 10.9 percent; seeds and plants, up 8.1 percent; tractors and self propelled farm machinery, up 8.0 percent; and labor, up 7.0 percent. The largest two expenditure categories were feed, which accounted for 13.9 percent of the U.S. total production expenses and farm services which accounted for 13.4 percent of the total. The farm services category includes expense items such as custom work, utilities, marketing charges, veterinary services, transportation costs, and miscellaneous business expenses.

The average expenditures per U.S. farm in 1997 were $88,216 compared to $84,977, as revised for 1996. On the average, U.S. farm operations in 1997 spent $12,276 on feed; $11,794 on farm services; $8,997 on rent; $8,915 on labor; and $6,917 on livestock and poultry purchases. Revised estimates for 1996 indicated that U.S. farms spent an average of $12,240 on feed; $11,414 on farm services; $8,889 on rent; $8,306 on labor; and $6,217 for livestock and poultry purchases.

The Farm Production Region contributing most to the total 1997 U.S. farm production expenditures was the Corn Belt with expenses of $33.4 billion, 18.5 percent of the U.S. total. Expenditures in the Corn Belt were down 1 percent from the 1996 level of $33.8 billion. For total expenditures, the Corn Belt was followed by the Pacific Region at $29.8 billion (1996 - $27.4 billion); Northern Plains $22.4 billion (1996 - $20.9 billion); Lake States $19.1 billion (1996 - $17.7 billion); and the Southern Plains at $15.8 billion (1996 - $15.8 billion).

United States July 1 Cattle Inventory Down 2 Percent

All cattle and calves in the United States as of July 1, 1998, totaled 107.0 million head, 2 percent below the 109.0 million on July 1, 1997 and 4 percent below the 111.5 million two years ago.

All cows and heifers that have calved, at [illegible] million, were 2 percent below the 44.0 million on July 1, 1997 and 4 percent below the 45.0 million two years ago. Beef cows, at 34.1 million, were down 2 percent from July 1, 1997 and 4 percent below two years ago. Milk cows, at 9.2 million, were down 1 percent from July 1, 1997 and 2 percent below two years ago.

Other class estimates on July 1, 1998, and the changes from July 1 last year and two years ago, respectively, are as follows:

- All heifers 500 pounds and over, 16.7 million, down 2 percent and down 3 percent.
- Beef replacement heifers, 5.0 million, down 6 percent and down 9 percent.
- Milk replacement heifers, 3.6 million, no change and down 3 percent.
- Other heifers, 8.1 million, down 1 percent and no change.
- Steers weighing 500 pounds and over, 14.5 million, down 2 percent and down 4 percent.
- Bulls weighing 500 pounds and over, 2.2 million, down 4 percent and down 8 percent.
- Calves under 500 pounds, 30.3 million, down 2 percent and down 4 [illegible]ent.
- All cattle and calves on feed for slaughter, 11.0 million, up 1 percent and up 12 percent.

The 1998 calf crop is expected to be 37.9 million, down 2 percent from 1997 and down 5 percent from 1996. This would be the smallest calf crop since 1951. Calves born during the first half of the year are estimated at 27.9 million, down 2 percent from 1997 and down 5 percent from 1996.

July U.S. All Sheep and Lambs Totals 9.40 Million Head

All sheep and lamb inventory in the United States on July 1, 1998, totaled 9.40 million head, 5 percent below July 1, 1997. Breeding sheep inventory declined to 5.58 million head on July 1, 1998, 3 percent below July 1997. Of the July 1, 1998 breeding herd, 4.56 million head were ewes one year old and older, 220,000 head were rams one year old and older, and 800,000 head were replacement lambs.

Market sheep and lambs, at 3.83 million head, were 7 percent below last July. Of the total market lambs, 62.3 percent were under 65 pounds, 19.3 percent were 65 to 84 pounds, 11.2 percent were 85 to 105 pounds, and the remainder, 7.2 percent, were over 105 pounds on July 1.

The 1998 lamb crop in the United States is expected to total 4.87 million head, down 7 percent from the 1997 lamb crop of 5.24 million head. Lambs born during January through June 1998 reached 4.25 million head or 87 percent of the yearly total. An additional 620,000 head are expected to be born during the period July through December 1998.

The July 1 sheep and lamb numbers are published by regions. Montana is included with Colorado, South Dakota, Utah and Wyoming. The total number of sheep and lambs in the region was 3.1 million head, down 8 percent from a year ago. This region accounted for 33.4 percent of the total U.S. sheep and lambs.

The region's breeding sheep and lambs inventory was 1.7 million head, down 8 percent from last year. Of the total breeding sheep and lambs, 1.4 million head were ewes one year old and older, 50,000 head were rams one year and older, and 230,000 head were replacement lambs.

All market sheep and lambs for the region totaled 1.4 million head, down 8 percent from a year ago. Of the total market lambs, 75.2 percent were under 65 pounds, 13.1 percent were 65 to 84 pounds, 4.6 percent were 85 to 105 pounds, and the remaining 7.1 percent were over 105 pounds.

Lambs born during January and June 1998 in the region reached 1.5 million head. An additional 25,000 are expected to be born during the period July through December 1998.

U.S. Cattle on Feed Up 2 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.16 million head on July 1, 1998. The inventory was 2 percent above July 1, 1997 and 17 percent above July 1, 1996. The inventory included 5.45 million steers and steer calves, up 1 percent from the previous year. This group accounted for 59 percent of the total inventory. Heifers and heifer calves accounted for 3.68 million head, up 5 percent from 1997.

Placements in feedlots during June totaled 1.56 million, 8 percent above 1997 and 20 percent above 1996. Net placements were 1.49 million. During June, placements of cattle and calves weighing less than 600 pounds were 262,000, 600-699 pounds were 374,000, 700-799 pounds were 487,000, and 800 pounds and greater were 440,000.

Marketings of fed cattle during June totaled 2.03 million, slightly below 1997 but 2 percent above 1996. Other disappearance totaled 72,000 during June, 20 percent above 1997 and 3 percent above 1996.

Montana & U.S. Red Meat Production Up For June

Montana slaughter plants produced 1.2 million pounds, dressed weight, of red meat during June 1998, up 21 percent from last month and 7 percent higher than this same time frame last year. Cattle slaughter at 1,400 head, was 100 higher than last year. The average live weight of 1,107 pounds was down 43 pounds from a year ago.

There were 1,800 head of hogs slaughtered in Montana during June, up 300 head from a year ago. The average live weight, 196 pounds, dropped 23 pounds from last year. Sheep slaughter amounted to 200 head, up 100 head from last year. The average live weight of 127 pounds was up 3 pounds.

U.S. commercial red meat production for the United States totaled 3.73 billion pounds in June, up 7 percent from the 3.49 billion pounds produced in June 1997. This was the second highest level for June, exceeded only by 3.80 billion pounds in June 1995. Beef production, at 2.25 billion pounds, was 5 percent above the previous year. Cattle slaughter totaled 3.11 million head, up 2 percent from 1997. The average live weight was up 37 pounds from the previous year, at 1,197 pounds.

Veal production totaled 20 million pounds, 24 percent below June a year ago and equaling the previous record low for June set in 1991. Calf slaughter totaled 116 thousand head, down 2 percent from June 1997. The average live weight was 284 pounds.

Pork production totaled 1.44 billion pounds, up 10 percent from the previous year. Hog kill totaled 7.73 million head, 10 percent above 1997. The average live weight was 1 pound below the previous year, at 255 pounds.

Lamb and mutton production, at 19 million pounds, was down 6 percent from June 1997. Sheep slaughter totaled 294 thousand head, 3 percent below last year. The average live weight was 134 pounds, down 4 pounds from June a year ago.

January - June red meat production was 22.1 million pounds, 5 percent above the comparable figure a year earlier. Accumulated beef production was up 1 percent from last year, veal was down 23 percent, pork was up 10 percent, and lamb and mutton was unchanged.

Pelt Production Up 7 Percent

Mink pelt production in the U.S. in 1997 totaled 2.84 million pelts, up 7 percent from 1996. Wisconsin, the major mink producing State, produced 701,400 pelts.

By color class, the number of pelts as a percent of the total U.S. production follows: Standard - 42.2 percent; Mahogany - 22.4 percent; Gunmetal - 16.2 percent; Ranch Wild - 6.6 percent; Sapphire - 4.5 percent. The remaining color classes accounted for 8.1 percent.

Mink pelts produced during the 1997 crop year were valued at $94.1 million dollars, up slightly from $93.9 million a year ago. The average price per pelt for the 1997 crop year was $33.10, down 6 percent from the price of $35.30 in 1996.

Female mink bred to produce kits in 1998 totaled 705,200, down 1 percent from the previous year. Percent of total females bred to produce kits in 1998 by color class are: Standard - 40.5 percent; Mahogany - 21.5 percent; Gunmetal - 16.4 percent; Ranch Wild - 5.9 percent; Sapphire - 5.7 percent. The remaining color classes accounted for 10.0 percent.

There were 401 mink farms producing pelts in 1997, down 3 percent from a year ago. Leading States were Utah with 125 farms, Wisconsin with 69 farms and Minnesota with 39. There were 29 mink farms which also raised fox in 1997, compared to 40 for the previous year.

1998 Montana Wheat and Barley Varieties Survey

Neeley remained the leading winter wheat variety seeded in Montana for the eleventh consecutive year with 272 thousand acres planted in the state.

Rocky maintained its position of the second most popular winter wheat variety for the second consecutive year. Montana farmers planted 194 thousand acres of Rocky this year, a decrease from the 305 thousand acres planted last year.

Tiber remained in the third place position for the second consecutive year, accounting for 191 thousand acres of winter wheat planted in the state.

McNeal was the leading spring wheat variety planted this year. This hard red spring wheat accounted for 27 percent of seeded acreage with over 964 thousand acres planted.

Amidon dropped to the second place position this year after a significant decrease in planted acreage. Montana farmers planted only 621 thousand acres, compared to 1.07 million acres planted last year.

Westbred Rambo remained the third most popular variety with 277 thousand acres planted this year in the state. This is a drop from last year's 436 thousand acres seeded.

Kyle continued to be the leading durum variety for the fifth consecutive year. Over 172 thousand acres of Kyle were planted in the state, accounting for 38 percent of the total seeded acres.

Sceptre moved up from the sixth place position last year to become the second most popular durum variety with nearly 56 thousand acres planted.

Vic is another variety to move up in position from fifth place last year. Now the third highest variety, 32 thousand acres were seeded in the state compared to 22 thousand acres in 1997.

Harrington remained the top malting barley variety planted in the state. It accounted for 43 percent of total seeded acreage with 603 thousand acres planted and is recommended by the American Malting Barley Association for planting in Montana.

Baronesse remained the leading feed-type barley for the third consecutive year. Over 163 thousand acres of Baronesse were planted this year.

The Montana Wheat and Barley Varieties report was made possible with funds provided by the Montana Wheat & Barley Committee and the American Malting Barley Association, Inc. A more detailed report may be obtained from our office upon request.

[1/] Revised. [2/] Soft White Wheat. [3/] American Malting Barley Association, Inc. recommended for malting and brewing for Montana, 1998.

June Egg Production Up 2 Percent

U.S. egg production totaled 6.42 billion during June 1998, up 2 percent from the 6.28 billion produced in 1997. Production included 5.40 billion table eggs and 1.02 billion hatching eggs, of which 960 million were broiler-type and 59.0 million were egg-type. The total number of layers during June 1998 averaged 308 million, up 3 percent from the total average number of layers during June 1997. June egg production per 100 layers was 2,086 eggs, down sightly from 2,093 eggs in June 1997.

Montana April-June Milk Production Down, U.S. Up

Montana milk cows produced 74 million pounds of milk during the period of April-June 1998, compared with 76 million pounds the same quarter a year ago. Montana milk cow inventory declined from 19,000 head a year ago to 18,000 head this year.

During the April-June period, the U.S. produced 41.0 billion pounds, 0.8 percent above the April-June period last year. The average number of milk cows in the U.S. during the April-June quarter was 9.20 million head, 81,000 head less than the same period last year.

July 1 Crop Production Forecast
Potato Acreage
Ag Prices Received
U.S. Wheat Supply, Disappearance, and Price

Crop Forecast Improves During June

Montana wheat production is expected to be the smallest since 1992. As of July 1, producers expect to harvest 157.5 million bushels of all wheat this year, 15 percent less than last year's crop. Growers expect to harvest 5.19 million acres of wheat, which is 12 percent less than a year ago and the smallest harvested acreage since 1992. Yield prospects have improved with excellent rainfalls during June.

Most of the state received above normal precipitation during June when grain formation occurred, significantly improving the condition of the crop. Forecasted yield for winter wheat is up 5 bushels from last month's forecast to 36 bushels per acre, if realized, this would be 3 bushels less than last year. Total winter wheat production is estimated at 45.0 million bushels, down 20 percent from last year due to the decrease in acreage for harvest and lower yield, but up 12 percent from last month's forecast. Growers intend to harvest 1.25 million acres of winter wheat, down 14 percent from last year and unchanged from last month.

Spring wheat producers plan to harvest 3.5 million acres, down 700,000 acres or 17 percent from last year. Forecasted yield is set at 29 bushels per acre, the same yield as a year ago. Total production is estimated at 101.5 million bushels, which is also down 17 percent from 1997. If realized, this would be the smallest spring wheat production since 1994. Durum wheat production is forecast at 11.0 million bushels, up 51 percent from a year ago and the largest durum wheat crop since 1981. Yield is estimated at 25 bushels per acre, down 1 bushel per acre from last year. Producers plan to harvest 440,000 acres, up 160,000 acres from 1997 and also the largest harvested acreage since 1981.

Barley yields are estimated at 50 bushels per acre, 3 bushels per acre less than last year. Total production is forecast at 65.0 million bushels, up 2 percent from 1997. Growers expect to harvest 1.3 million acres, up 100,000 acres from a year ago. Oat production is forecast at 4.48 million bushels, up 16 percent from 1997. The forecasted yield of 56 bushels per acre is up 1 bushel from last year's yield. At 80,000 acres, growers intend to harvest 10,000 acres more than 1997 and the same amount as 1995.

At the U.S. level, all wheat production is placed at 2.52 billion bushels, slightly less than 1997, but 10 percent more than in 1996. Based on July 1 conditions, the U.S. yield is forecast at 42.6 bushels per acre. This is up 2.9 bushels from a year ago to a new record high yield. Winter wheat production is forecast at 1.9 billion bushels, up 9 percent from last month and 1 percent higher than 1997. The U.S. yield is forecast at a record high 46.6 bushels per acre. This is up 3.7 bushels from June 1. Grain area was not changed from last month.

Nationally, other spring wheat production is forecast at 498 million bushels, down 11 percent from 1997. A 20 percent drop in grain area is the main cause of the decline. The U.S. yield is forecast at 33.5 bushels per acre, up 3.6 bushels per acre from last year. Hard Red Spring production is down 11 percent to 445 million bushels. White Spring production is down about 8 percent. Durum wheat production is forecast at 126 million bushels, up 46 percent from 1997. Based on July 1 conditions, the U.S. yield is forecast at 35.1 bushels per acre, up 7.4 bushels per acre from last year. This yield increase, along with a 15 percent increase in harvested acres, results in the largest crop since 1982.

U.S. barley production for 1998 is forecast at 376 million bushels, up only fractionally from a year ago and up 5 percent from 1996. The first forecast for 1998 indicates that producers expect yields to average 61.9 bushels per acre, an increase of 3.6 bushels from last year. Area harvested and to be harvested, at 6.08 million acres, is 5 percent below the 6.43 million acres harvested the previous year. The higher expected yields in 1998 have offset the acreage declines from last year to keep production nearly the same as 1997.

U.S. oat production for the 1998 crop year is forecast at 183 million bushels, 4 percent above 1997 production. If realized, this would be the fourth smallest crop since records were first kept in 1866. The forecasted yield, at 62.4 bushels per acre, is up 1.9 bushels from last year's 60.5 bushels per acre and the highest average yield since 1992. Area harvested and to be harvested for grain in 1998 is 2.94 million acres, up 1 percent from 1997. If realized, this would be the third smallest acreage harvested for grain on record.

July 1, 1998 Potato Planted and Harvested Acreage

Montana potato producers planted an estimated 10,600 acres this year, up 200 acres from last year. Currently, producers intend to harvest all of these acres. This is the largest planted and harvested acreage since 1950.

U.S. potato farmers have planted an estimated 1.40 million acres in all four 1997 seasons, up 3 percent from last year. Area for harvest is forecast at 1.38 million acres, up 4 percent from last year.

1/ District estimates of stocks funded by the Montana Wheat & Barley Committee.

May Ag Prices Received Mostly Mixed

The Montana winter wheat average price decreased 22 cents from April 1998 to $3.06 per bushel, durum wheat was down 10 cents to $4.77 per bushel, and spring wheat was unchanged at $3.55 per bushel. The all wheat price for mid-June averaged $3.24 per bushel and the all barley price for mid-June was $2.26. Feed barley is down 4 cents per bushel to $1.92, but malt barley increased 3 cents to $2.77 per bushel. The price for alfalfa hay in May, was $71.00 per ton, unchanged from last month. The May other hay price of $61.00 rose $1.00 from April.

With the exception of lambs, livestock prices for the full month of May were below April prices. Steer and heifer prices decreased $3.10 to $75.90 per cwt. Cows were down $2.70 to $37.20 and the average price for calves fell $1.90 to $87.00 per cwt. Sheep prices decreased $8.40 to $26.70 per cwt, but lambs increased 70 cents to $71.00 per cwt. Milk prices decreased 70 cents from last month to $13.80 per cwt. Steer and heifer prices for mid-June averaged $70.20 per cwt.

Nationally, the all wheat price for May at $3.06 per bushel, was down 9 cents from April. The all barley price was unchanged at $2.14 per bushel. Steer and heifer prices were the same at $66.30 per cwt. Cow prices were $36.40 and hog prices were $42.20 per cwt. Egg prices were 54.8 cents per dozen.

The All Farm Products Index of Prices Received in June was 101 based on 1990-92=100, down 2 points (1.9 percent) from May. Price decreases from May for cantaloupes, lettuce, corn, and tomatoes more than offset price increases for broilers, milk, oranges, and eggs. The seasonal changes in the mix of commodities farmers sell also affect the overall index level; however, these changes were essentially offsetting in June.

Compared with June 1997, the All Farm Products Index was 6 points (5.6 percent) lower. Price decreases from June 1997 for wheat, hogs, soybeans, and corn more than offset price increases for milk, broilers, potatoes, and peaches.

United States Index Summary

1/ Insufficient sales to establish a price. 2/Composite of steers, heifers, and cows. 3/ Mid-month prices for sheep and lambs discontinued January 1996.

Projected U.S. Wheat Stocks up

Projected U.S. 1998/99 ending stocks are up 41 million bushels from last month as larger production more than offsets reduced carryin stocks and expanding use. Winter wheat production is forecast up 155 million bushels from last month because of larger area and higher yields. However, the first survey-based forecast of spring wheat production (including durum) is down. Projected domestic feed and residual use is up 100 million bushels from last month because of large supplies in the Great Plains and weak export demand for soft wheat. Export prospects for U.S. white wheat and soft red winter wheat are weak because of ample supplies in competing exporters and reduced demand in several importing countries. The projected price range is down 20 cents on each end to $2.70 to $3.10 per bushel.

Montana's Wheat Acreage the Smallest Since 1991

Montana spring wheat producers planted 3.6 million acres of spring wheat this year, down just over 17 percent from last year and down 8 percent from what they intended to plant March 1. Lower prices and drought-like conditions in many areas of the state held back producers from seeding on marginal and recrop land. Producers intend to harvest 3.5 million acres. Better prices for **durum** led producers to plant 450,000 acres of durum this spring, up 55 percent from a year ago. If conditions permit, producers will harvest 440,000 acres. **Winter wheat** seeded acreage was estimated at 1.4 million acres, down 12 percent from 1997 and the smallest planted acreage of winter wheat since 1941. Winter wheat acreage for harvest has been revised down to 1.25 million acres. Dry conditions and more winterkill than earlier identified led to the lowered harvest estimate. All wheat planted acreage estimated at 5.45 million acres is the smallest crop since 1991.

Barley producers seeded 1.4 million acres this year, up 100,000 acres from a year ago. Harvested barley acreage was estimated at 1.3 million acres. **Oat** acreage remained the same as last year at 140,000 acres with 80,000 acres intended to be harvested for grain. **Corn** producers seeded 50,000 acres for all purposes, down 10,000 acres from last year. Growers intend to harvest 15,000 acres for grain, up 5,000 acres from 1997. **Dry bean** planted acreage is unchanged from last year at 12,200 acres. **Sugar beet** acreage increased 4,400 acres to 64,300. **Hay** harvested acreage is expected to decline 13 percent from last year with alfalfa acreage decreasing to 1.5 million acres and other hay decreasing to 750,000 acres. Low moisture supplies early on have caused most of the decrease in acreage.

At the **U.S.** level, the 1998 **all wheat** planted area is estimated at 65.8 million acres while grain area is placed at 59.2 million acres. Both levels are down 7 percent from 1997. This is the lowest planted area in ten years and the lowest grain area since 1991. Winter wheat area for grain is now estimated at 40.8 million acres, up somewhat from the June 1 forecast, but 3 percent less than last year. Planted acres at 46.9 million acres are also down 3 percent from last year, but fractionally higher than the previously published level. **Durum wheat** planted area is estimated at 3.70 million acres, up 14 percent from 1997. Intentions are to harvest 3.58 million acres for grain, up 13 percent from last year. The planted acreage is down 9 percent from the "Prospective Plantings" report, but is still the highest since 1989. **Other spring wheat** area planted for 1998 is estimated at 15.2 million acres, down 21 percent from 1997 and 7 percent from the "Prospective Plantings" report. Grain area is expected to total 14.9 million acres, down 20 percent from last year. Both levels are the lowest in ten years.

U.S. barley growers seeded 6.45 million acres of barley for 1998, down 7 percent from the 6.91 million acres seeded a year ago. This year's barley crop is the lowest acreage planted since records were first kept. Acreage expected for grain harvest in 1998 at 6.08 million acres is down 5 percent from the 1997 harvested grain acreage. **Oats** planted last fall and this spring totaled 4.99 million acres, down 3 percent from last year's final seeded acres. If producers meet their expectations, acreage seeded would be the second lowest recorded since 1866, exceeding only the 1996 acreage of 4.66 million acres. Growers expect to harvest 2.94 million acres for grain in 1998, up 1 percent from 1997. If realized, this would be the third smallest acreage harvested for grain on record.

Corn planted, at the U.S. level, for all purposes is estimated at 80.8 million acres, up 1 percent from last year. This is the largest planted acreage since 1985. Growers expect to harvest 74.3 million acres for grain, up 1 percent from 1997. Planted acreage of **dry beans** for the 1998 crop is estimated at 2.05 million acres this year, up 11 percent from both last year and two years ago. Acreage for harvest is forecast at 1.94 million acres, 13 percent above a year ago and 11 percent above 1996. Area planted to sugar beets is expected to total 1.49 million acres in the 12 producing states.

Hay producers, at the U.S. level, expect to harvest 59.8 million acres of hay in 1998, down 2 percent from the 60.8 million acres harvested the previous year. **Alfalfa** and alfalfa mixtures are expected to total 23.4 million acres, down 1 percent from 1997. All other hay is estimated at 36.4 million acres, 2 percent below last year. With higher hay prices than normal and depleted hay stocks, the demand for hay remained high. Weather related problems have reduced the availability of hay land in many areas.

The Montana crop acreage and grain stocks estimates in this issue of the Reporter are the result of surveying approximately 3,000 Montana farmers and ranchers during June. Names were selected on a statistical probability basis. SPECIAL THANKS to those operators that were interviewed and responded to the survey. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics.

June 1, 1998 Grain Stocks

All wheat stocks in Montana on June 1 ,1998 totaled 67.0 million bushels, up 80 percent from the same quarter last year. Stocks stored on the farm accounted for 53.0 million bushels of the total with the remaining 14.0 million bushels stored off farm. All spring wheat stocks, at 43.0 million bushels, was up 52 percent from last year and accounted for 64 percent of the total wheat stocks. Winter wheat stocks were estimated at 24.0 million bushels, up from 8.8 million bushels last year. Durum wheat stocks were estimated at 2.6 million bushels, down 20 percent from last year. All wheat disappearance for the March-May quarter was 37.0 million bushels, compared with 41.4 million for the same quarter last year. Barley stocks in all positions on June 1, 1998 were up 23 percent from last year and were set at 9.0 million bushels. Oat stocks were down 28 percent from a year ago and were estimated at 790,000 bushels.

March 1, 1998 barley stocks were revised to 21.6 million bushels, 1.0 million bushels above the previous estimate. March-May disappearance of barley was 12.6 million bushels, 3.1 million bushels more than the same quarter in 1997.

Red Meat Production Down For Montana

Montana slaughter plants produced 1.0 million pounds, dressed weight, of red meat during May 1998, down 12 percent from last year, and down 3 percent from last month. Cattle slaughter, at 1,200 head, was 200 head less than from last year. The average live weight of 1,098 pounds was down 38 pounds from a year ago.

There were 1,500 head of hogs slaughtered in Montana during May, up 200 head from a year ago. The average live weight, at 204 pounds, dropped 18 pounds from last year. Sheep slaughter amounted to 100 head, unchanged from last year. The average live weight of 128 pounds was up 3 pounds.

U.S. commercial red meat production for the United States totaled 3.58 billion pounds in May, up slightly from the 3.57 billion pounds produced in May 1997. Beef production, at 2.12 billion pounds, was 3 percent below the previous year. Cattle slaughter totaled 2.96 million head, down 7 percent from 1997. The average live weight was up 39 pounds from the previous year, at 1,188 pounds.

Veal production totaled 19 million pounds, 27 percent below May a year ago and 5 percent below the previous record low for May set in 1993. Calf slaughter totaled 102 thousand head, down 13 percent from May 1997. The average live weight was 302 pounds.

Pork production totaled 1.42 billion pounds, up 7 percent from the previous year. Hog kill totaled 7.57 million head, 7 percent above 1997. The average live weight was unchanged from the previous year, at 256 pounds.

Lamb and mutton production, at 19 million pounds, was down 11 percent from May 1997 and 10 percent below the previous record low for May set in 1996. Sheep slaughter totaled 281 thousand head, 11 percent below last year. The average live weight was 139 pounds, unchanged from May a year ago.

U.S. May Milk Production Up 2.1 Percent

Milk production in the 20 major States during May totaled 12.1 billion pounds, up 2.1 percent from production in these same States in May 1997. April revised production, at 11.6 billion pounds was up 1.3 percent from April 1997.

Production per cow in the 20 major States averaged 1,564 pounds for May, 35 pounds above May 1997. The number of cows on farms in the 20 major States was 7.75 million head, 16,000 head less than May 1997 but 14,000 head more than April 1998.

U.S. Cattle on Feed Up 1 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.70 million head on June 1, 1998. The inventory was 1 percent above June 1, 1997 and 13 percent above June 1, 1996.

Placements in feedlots during May totaled 2.03 million, 9 percent above 1997 and 30 percent above 1996. Net placements were 1.94 million. During May, placements of cattle and calves weighing less than 600 pounds were 305,000, 600-699 pounds were 392,000, 700-799 pounds were 707,000, and 800 pounds and greater were 627,000. Marketings of fed cattle during May totaled 1.95 million, 5 percent below both 1997 and 1996. Other disappearance totaled 93,000 during May, 21 percent below 1997 but 11 percent above 1996.

U.S. Hog Inventory Up 6 Percent

U.S. inventory of all hogs and pigs on June 1, 1998, was 61.6 million head. This was 6 percent above June 1997, and 3 percent above March 1, 1998.

Breeding inventory, at 7.02 million head, was up 1 percent from June 1, 1997 and up slightly from March 1, 1998. Market hog inventory, at 54.6 million head, was 6 percent above last year, and 3 percent above last quarter.

The March-May 1998 U.S. pig crop, at 26.7 million head, was 5 percent more than 1997 and 7 percent more than 1996. Sows farrowing during this period totaled 3.06 million head, 4 percent above last year. The sows farrowed during this quarter represented 44 percent of the breeding herd. The average pigs per litter continues to increase, with an average of 8.74 pigs saved per litter for the March-May period. Last year the litter rate averaged 8.65 pigs. Pigs saved per litter by size of operation ranged from 7.30 for operations with 1-99 hogs to 8.90 for operations with more than 5,000 hogs and pigs.

U.S. hog producers intend to have 3.03 million sows farrow during the June-August 1998 quarter, 3 percent above the actual farrowings during the same period in 1997 and 10 percent above 1996. Intended farrowings for September-November 1998, at 3.04 million sows, are 4 percent above the same period last year and 12 percent above 1996.

The total number of hogs under contract, owned by operations with over 5,000 head, but raised by contractees, accounted for 27 percent of the total U.S. hog inventory.

May Egg Production Up 2 Percent

U.S. egg production totaled 6.63 billion during May 1998, up 2 percent from the 6.51 billion produced in 1997. Production included 5.56 billion table eggs and 1.07 billion hatching eggs, of which 1.01 billion were broiler-type and 62.0 million were egg-type. The total number of layers during May 1998 averaged 308 million, up 2 percent from the total average number of layers during May 1997. May egg production per 100 layers was 2,150 eggs, down sightly from May 1997.

All layers in the U.S. on June 1, 1998, totaled 308 million, up 2 percent from a year ago. The 308 million layers consisted of 251 million layers producing table or commercial type eggs, 54.9 million layers producing broiler-type hatching eggs, and 2.63 million layers producing egg-type hatching eggs. Rate of lay per day on June 1, 1998, averaged 69.1 eggs per 100 layers, down 1 percent from the 70.0 a year ago.

Laying flocks in the 30 major egg production States produced 6.27 billion eggs during May, up 1 percent from May 1997. The average number of layers during May, at 291 million, was up 2 percent from a year earlier.

June 1, 1998 Cherry Production Forecast

Montana sweet cherry producers expect total production to increase by 15 percent to 3.0 million pounds. Most growers noted good pollinating weather and good drop weather. Most the of the trees replanted after the 1989 frost are producing now. If expectations are met this will be the largest cherry crop since 1988, the last year before the frost.

U.S. sweet cherry production is forecast at 192,900 tons, down 13 percent from 1997, but 25 percent above 1996. California and Washington expect declines, but Oregon will stay even with a year ago.

1997 Milk Production, Disposition, and Income

Montana's 1997 milk production of 295 million pounds decreased 4 percent from 1996. An average of 19,000 milk cows were on farms and ranches during the year, 1,000 less than a year ago. The rate per cow averaged 15,526 pounds, 176 pounds more than 1996.

Cash receipts from marketings of milk during the year in Montana were 37.5 million dollars, down 16 percent from 1996. Producer returns averaged $13.20 per cwt, a decrease of $2.00 from last year. Marketings totaled 284 million pounds, down 3 percent from a year ago. A total of 11 million pounds of milk were used on farms and ranches where produced, 7 million pounds were fed to calves, and 4 million were consumed as milk, cream, and butter.

Nationally, milk production increased 2 percent in 1997 to 157 billion pounds. The rate per cow at 16,915 pounds, was 436 pounds above 1996. The annual average number of cows on farms at 9.26 million head, was 103,000 less than 1996.

Cash receipts from marketings of milk during 1997 were $21.0 billion dollars, 8 percent below 1996. Producer returns averaged $13.53 per hundredweight, $1.41 per hundredweight below 1996. Marketings totaled 155 billion pounds, 2 percent above 1996. Marketings include whole milk sold to plants and dealers as well as milk sold directly to consumers.

An estimated 1.43 billion pounds of milk were used on farms where produced, 4 percent less than 1996. Calves were fed 82 percent of this milk with the remainder consumed in producer households.

U.S. April Milk Production Up 1.0 Percent

Milk production in the 20 major States during April totaled 11.6 billion pounds, up 1.0 percent from production in these same States in April 1997. March revised production, at 11.7 billion pounds was up 0.7 percent from March 1997.

Production per cow in the 20 major States averaged 1,496 pounds for April, 22 pounds above April 1997. The number of cows on farms in the 20 major States was 7.73 million head, 32,000 head less than April 1997 but 6,000 head more than March 1998.

Montana Red Meat Production Down, While U.S. Red Meat Production Sets Record High

Montana slaughter plants produced 1.0 million pounds, dressed weight, of red meat during April 1998, down 6 percent from April 1997. Cattle slaughter totaled 1,100 head, 200 head less than a year ago. The average live weight, at 1,140, was down 4 pounds from a year ago.

During April, there were 1,600 head of hogs slaughtered, 100 more than last year. The average live weight decreased 10 pounds to 211 pounds. Sheep slaughter was the same as a year earlier at 100 head, however, the average live weight increased 3 pounds to 129 pounds.

Commercial red meat production for the United States totaled 3.70 billion pounds in April, up 3 percent from the 3.59 billion pounds produced in April 1997 and just above the previous record high for April set in 1996.

Beef production, at 2.09 billion pounds, was slightly below the previous year. Cattle slaughter totaled 2.93 million head, down 4 percent from 1997. The average live weight was up 37 pounds from the previous year, at 1,189 pounds.

Veal production totaled 20.0 million pounds, 28 percent below April a year ago and 9 percent below the previous record low for April. Calf slaughter totaled 109 thousand head, down 15 percent from April 1997. The average live weight was 299 pounds.

Pork production totaled 1.57 billion pounds, up 8 percent from the previous year and 3 percent higher than the previous record high for April set in 1980. Hog kill totaled 8.33 million head, 8 percent above 1997. The average live weight was 1 pound above the previous year, at 257 pounds. Lamb and mutton production, at 25.0 million pounds, was up 14 percent from April 1997. Sheep slaughter totaled 384 thousand head, 14 percent above last year. The average live weight was 133 pounds, unchanged from April a year ago.

PLEASE RETURN

April Egg Production Up 3 Percent

U.S. egg production totaled 6.57 billion during April 1998, up 3 percent from the 6.35 billion produced in 1997. Production included 5.53 billion table eggs and 1.04 billion hatching eggs, of which 979 million were broiler-type and 62.0 million were egg-type. The total number of layers during April 1998 averaged 311 million, up 2 percent from the total average number of layers during April 1997. April egg production per 100 layers was 2,116 eggs, up 1 percent from April 1997.

All layers in the U.S. on May 1, 1998, totaled 309 million, up 2 percent from a year ago. The 309 million layers consisted of 251 million layers producing table or commercial type eggs, 55.4 million layers producing broiler-type hatching eggs, and 2.64 million layers producing egg-type hatching eggs. Rate of lay per day on May 1, 1998, averaged 69.7 eggs per 100 layers, up 1 percent from the 69.1 a year ago.

Laying flocks in the 30 major egg production States produced 622 billion eggs during April, up 3 percent from April 1997. The average number of layers during April, at 294 million, was up 2 percent from a year earlier.

U.S. Cattle on Feed Down 2 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.72 million head on May 1, 1998. The inventory was 2 percent below May 1, 1997 but 6 percent above May 1, 1996.

Placements in feedlots during April totaled 1.58 million, 2 percent above 1997 and 16 percent above 1996. Net placements were 1.49 million. During April, placements of cattle and calves weighing less than 600 pounds were 232,000, 600-699 pounds were 349,000, 700-799 pounds were 566,000, and 800 pounds and greater were 436,000.

Marketings of fed cattle during April totaled 1.88 million, 2 percent below 1997 and 1 percent below 1996. Other disappearance totaled 92,000 during April, 6 percent below 1997 and 14 percent below 1996.

Cattle on Feed in Historic 7 States Down 2 Percent

Cattle on feed May 1, 1998, in the historic 7 States for feedlots with capacity of 1,000 or more head totaled 8.30 million, down 2 percent from the previous year but 7 percent above May 1, 1996. Placements in feedlots during April totaled 1.36 million, 5 percent above 1997 and 18 percent above 1996. Marketings during April totaled 1.61 million, 2 percent below 1997 and slightly below 1996. Other disappearance during April was 61,000 head, 10 percent below 1997 and 6 percent below 1996.

Montana Potato Stocks Up 17 Percent, U.S. Stocks Down 15 Percent

Montana potato producers held 350,000 cwt. of potatoes in storage on May 1, compared with the 300,000 held in storage last year. The stocks account for 11 percent of the total production from the 1997 crop. Last year's May 1 inventory accounted for 9 percent of the 1996 crop.

Stocks are the quantity (whether sold or not) remaining in storage for all purposes and uses, including seed potatoes not yet moved, and shrinkage, waste, and other losses that occur after the date of each report. Sales of fall potatoes for all purposes for the past 5 years averaged 90.5 percent of the total fall production. Shrinkage, loss, and home use accounted for the remaining 9.5 percent.

U.S. potato stocks on May 1, 1998, totaled 87.1 million cwt, down 15 percent from a year earlier but 14 percent above two years ago. Disappearance from the start of harvest to May 1 was 320 million cwt, 6 percent below a year ago but 1 percent above two years ago. Disappearance during April was 42.2 million cwt, down 6 percent from last year but 5 percent above two years ago. Seasonal shrink and loss was estimated at 26.6 million cwt, down 14 percent from last year and 9 percent below two years ago.

Processing of 1997 crop potatoes totaled 155 million cwt so far this season, down 7 percent from last year and 1 percent below two years ago. April processing claimed 17.7 million cwt of potatoes, down 4 percent from last year but 5 percent above two years ago.

Western States held 68.7 million cwt of potatoes in storage on May 1, down 12 percent from last year but up 13 percent from 1996. Idaho's stocks fell 11 percent from a year ago but were 1 percent above two years ago. Idaho's storage held 53 percent of the western stocks. Colorado's storages were down 17 percent, Oregon's stocks were off 29 percent year, and Washington's stocks were off 3 percent from last year. California's stocks stayed the same as the last two years. Each of the Western States, except California, had more potatoes in storage than two years ago.

1997 Agricultural Chemical Use Estimates for Winter and Spring Wheat

Montana winter wheat producers applied nitrogen fertilizer to 95 percent of the harvested winter wheat acreage in 1997. A total of 64.5 million pounds of nitrogen fertilizer was applied to the 1.45 million acres of winter wheat harvested in Montana. Of the harvested area, 78 percent received phosphate fertilizer while potash was used on 23 percent of the acres. Total application of phosphate was 31.4 million pounds and potash was 4.3 million pounds.

Montana winter wheat producers applied 1.09 million pounds of herbicides to 88 percent of the harvested winter wheat acres in 1997. The most common herbicide used was 2, 4-D with 72 percent of the acreage being sprayed. Dicamba and Glyphosate were the next popular herbicides used at 38 and 35 percent respectively. (Continued on back)

U.S. Hired Workers Down 1 Percent, Wages Up 7 Percent From a Year Ago

There were 1,005,000 hired workers on the Nation's farms and ranches the week of April 12-18, 1998, down 1 percent from a year ago. There were 803,000 workers hired directly by farm operators. Agricultural service employees on farms and ranches made up the remaining 202,000 workers. Migrant workers accounted for 6.6 percent of the April hired workforce compared to 6.3 percent last year.

Farm operators paid their hired workers an average wage of $7.50 per hour during the April 1998 survey week, up 47 cents from a year earlier. Field workers received an average of $7.00 per hour, up 36 cents. Livestock workers earned $6.99 per hour compared with $6.40 a year earlier.

The June Agricultural Survey is Underway

You may be part of a sample of Montana producers that will be asked by interviewers to participate in the survey between May 25 and June 12. **Please say yes!** This survey is particularly vital because it will provide the first clear indications of the potential production of major commodities in 1998.

The information gathered is widely used. Producers rely on the data to reach valid production, marketing, and investment decisions. Industry analysts, extension agents and farm organizations use the information in a variety of ways that benefit farmers.

We safeguard the confidentiality of all survey responses. Information from individual operations is combined with other responses to provide the needed data. Montana Agricultural Statistics Service works with all farmers and ranchers to provide meaningful, accurate, and objective statistics that help keep Montana's and the Nation's agriculture informed.

1997 Agricultural Chemical Use (Continued)

Montana spring wheat producers planted 4.35 million acres of spring wheat in 1997. Seventy nine percent of these acres had nitrogen fertilizer applied to them. A total of 153.5 million pounds of nitrogen was applied. Phosphate was applied to 66 percent and potash to 15 percent of the planted spring wheat acreage. Total application of phosphate was 68.2 million pounds and potash was 10.2 million pounds.

Montana spring wheat producers applied 1.43 million pounds of herbicides to 94 percent of the total planted spring wheat acres in 1997. The most widely used herbicide was 2, 4-D with 83 percent of the acreage being sprayed. Dicamba was the second most common herbicide used on 31 percent. Glyphosate and triallate were each used on 23 percent of the planted acres.

Winter wheat producers applied nitrogen fertilizer to 84 percent of the winter wheat harvested acres in the fourteen surveyed States. Of the harvested area, 53 percent received phosphate fertilizer and potash was used on 15 percent of the fourteen State area. All surveyed States treated at least a portion of the harvested area with herbicides with 2,4-D again the most widely used in area applied and quantity.

Most of the planted acres of North Dakota's durum and the collective 4-state other spring wheat plantings (MT, MN, ND, and SD) had primary fertilizer percent coverages similar to that of 1996. The three most popular herbicides, in terms of area covered for spring wheat other than durum were 2,4-D, MCPA, and dicamba.

The agricultural chemical use estimates in this report are based on data compiled from the Agricultural Resources Management Study conducted during the Fall of 1997. All results refer to on-farm use of fertilizers and pesticides on the targeted crops for the 1997 crop year. Data were collected late in the growing season or after the farm operator has indicated that planned applications were completed.

- Ag Prices Received

May 1 Crop Production

As of May 1, **Montana winter wheat** producers were expecting a yield of 34 bushels per acre, down 5 bushels from last year. If realized, total production of 44.2 million bushels would be 22 percent less than a year ago due to both lowered expected yields and a decrease of acreage.

Dry conditions last fall led producers to plant 1.4 million acres, the smallest winter wheat crop since 1941. Producers expect to harvest 1.3 million acres which would be the smallest harvested acreage since 1956. There are many concerns about the lack of moisture. Most areas of the state have experienced less than normal precipitation last fall and winter and the spring months to date. Reporters say that if rain doesn't come very soon average yields will fall more. The condition of the winter wheat crop was rated at 7 percent very poor, 18 percent poor, 39 percent fair, 34 percent good, and 2 percent excellent for the week ending May 11.

U.S. winter wheat production is forecast at 1.71 billion bushels, down 9 percent from last year. Based on conditions as of May 1, the U.S. yield is forecast at 41.9 bushels per acre. This is down 3.1 bushels from last year's record high average but, if realized, would still be the second highest U.S. average. Grain area totals 40.7 million acres, down 3 percent from 1997. All classes of wheat are down from last year with Hard Red showing the largest percentage drop.

1/ District data funded by the Montana Wheat & Barley Committee.

May 1 Hay Stocks

Montana hay producers had an estimated 1.15 million tons of hay on hand as of May 1, over twice the amount during the same time last year. Good production last year and a mild winter led to the increase in stocks. Disappearance from December 1997 to May 1 totaled 3.89 million tons.

U.S. stocks of **all hay** on farms totaled 21.7 million tons on May 1, 1998, up 25 percent from May 1 of the previous year. Disappearance of hay from December 1, 1997 - May 1, 1998, totaled 80.9 million tons, 7.5 percent lower than the 1996 crop disappearance of 87.5 million tons for the same period. Stocks of hay on May 1, 1998 were higher or unchanged compared to last year in 31 of the 48 estimating states. Mild winter conditions and adequate spring rains across the United States revitalized pasture lands and allowed livestock producers to reduce feeding of hay.

1997 Manufactured Dairy Products

Montana dairy plants produced 182,000 gallons of lowfat, hard ice cream during 1997, 2 percent more than the 1996 production. Lowfat, soft ice cream production totaled 1.3 million gallons, down slightly from last year. Lowfat ice cream mix production totaled 760,000 gallons, 2 percent less than last year.

Nationally, total cheese production, excluding cottage cheeses, was 7.33 billion pounds, 2 percent above the 1996 production. Wisconsin was the leading State with 29 percent of the production. American type cheese production, at 3.29 billion pounds, was slightly above 1996 and accounted for 45 percent of total cheese in 1997.

Italian varieties, with 2.88 billion pounds produced, were 2 percent above the 1996 production. Mozzarella accounted for 78 percent of the Italian production followed by Ricotta with 8 percent and Provolone with 7 percent. Wisconsin was the leading State in Italian cheese production with 30 percent of the production.

Production of butter in the United States during 1997 totaled 1.15 billion pounds, 2 percent less than 1996. California accounted for 27 percent of the production, followed by Wisconsin with 26 percent and Washington with 8 percent. Ice cream production increased in 1997. Regular ice cream production totaled 906 million gallons, up 3 percent from 1996. Lowfat ice cream, at 386 million gallons, was up 5 percent.

Nonfat dry milk for human food production, at 1.22 billion pounds, was up 15 percent from 1996. Dry whole milk, at 122 million pounds, was down 9 percent.

1997 Poultry Production and Value

Montana's 1997 value of egg sales of $4.2 million was 30 percent lower than last year due to decreased production and lower average price. Egg production was 19 percent lower than last year. The average price was 57 cents per dozen, down 9 cents.

Montana's value of sales from chickens, excluding broilers, was $26,000. Chickens sold for an average price of 2 cents per pound which is the same as last year. The number of pounds sold decreased 20 percent from 1996.

The national combined value of production from broilers, eggs, and turkeys and the value of sales from chickens in 1997, was $21.6 billion, down 1 percent from the $21.9 billion in 1996. Of the combined total, 65 percent was from broilers, 21 percent from eggs, 13 percent from turkeys, and less than 1 percent from other chickens.

The U.S. value of broilers produced during 1997 was $14.2 billion, up 2 percent from the $13.9 billion in 1996. The total number of broilers produced in 1997 was 7.76 billion, up 2 percent from 1996. The total live weight of broilers produced in 1997 was 37.5 billion pounds, up 3 percent from 1996. The 1997 average price per pound on a live weight equivalent basis was 37.7 cents per pound, compared to 38.1 cents per pound in 1996.

Value of egg production in 1997 was $4.53 billion, down 5 percent from the $4.76 billion in 1996. Egg production totaled 77.4 billion eggs, up 1 percent from the 76.3 billion eggs produced in 1996. In 1997, eggs averaged 70.2 cents per dozen, compared with 74.9 cents in 1996.

The value of turkeys produced during 1997 was $2.88 billion, down 8 percent from the $3.13 billion the previous year. Turkey production in 1997 totaled 7.22 billion pounds live weight, compared with 7.23 billion pounds in 1996. The average price received by producers during 1997 was 39.9 cents per pound, compared with 43.3 cents in 1996.

The value of sales from chickens (excluding broilers) in 1997 was $72.5 million, up 18 percent from the $61.5 million a year ago. Prices averaged 7.7 cents per pound, compared with 6.7 cents in 1996. The number of chickens sold in 1997 totaled 191 million, up 10 percent from the total sold during the previous year.

See the chicken and egg table on the back page.

Ag Prices Received for March

The Montana winter wheat average price decreased 9 cents from February 1998 to $3.17 per bushel, durum wheat was down 5 cents to $4.93 per bushel, and spring wheat increased 11 cents to $3.52 per bushel. Feed barley is down 7 cents per bushel to $2.00, but malt barley increased 8 cents to $3.10 per bushel. The all wheat price for mid-April averaged $3.38 per bushel and the all barley price for mid-April was $2.76. The price for alfalfa hay in April, was $71.00 per ton, unchanged from last month. The April other hay price of $60.00 dropped $3.00 from March. This is the lowest price for other hay since November 1996.

Livestock prices for the full month of March were mixed. Steer and heifer prices decreased $1.60 to $78.20 per cwt. Cows increased 80 cents to $38.10 and the average price for calves fell 60 cents to $89.00 per cwt. Sheep prices increased $2.00 to $41.90 per cwt., but lambs decreased $6.20 to $70.90 per cwt. Milk prices increased 10 cents from last month to $14.50 per cwt. Steer and heifer prices for mid-April averaged $78.50 per cwt.

Nationally, the all wheat price for March, at $3.32 per bushel, is up 5 cents from February. The all barley price averaged $2.42 per bushel, up 3 cents. Steer and heifer prices were up $1.00 to $64.30 per cwt. Cow prices were $36.00 and hog prices were $34.80 per cwt. Egg prices were 69.9 cents per dozen.

The All Farm Products Index of Prices Received in April was 105 based on 1990-92=100, up 3 points (2.9 percent) from March. Price increases from March for lettuce, cattle, broilers, and oranges more than offset price decreases for corn, milk, eggs, and soybeans. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Higher seasonal marketings of cattle, milk, strawberries, and oranges more than offset the relatively lower marketings of wheat, corn, soybeans, and cotton. These changes contributed one point of the three point increase in the overall index.

Compared with April 1997, the All Farm Products Index was 1 point (0.9 percent) lower. Price decreases from April 1997 for hogs, wheat, corn, and soybeans more than offset price increases for milk, lettuce, strawberries, and tomatoes.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Mar. 1997	Arp. 1997	Mar. 1998	Apr. 1998

1997 Meat Animal Production, Disposition and Income

Cash receipts from 1997 marketings of cattle, sheep, and hogs in Montana totaled $921 million, up 26 percent from 1996. The increase in cash receipts over the previous year is mainly due to higher prices received for cattle and calves, sheep and lambs, and hogs and pigs. Increased marketings of cattle and calves also contributed to higher cash receipts for the state. Cash receipts from the sales of cattle and calves rose 31 percent from 1996 to $857 million.

Marketings of cattle weighing 500 lbs or more at 1.44 million head were up slightly from the 1.435 million head last year, while marketings of calves weighing less than 500 lbs were up 32 percent to 270,000 head. The average price received for cattle over 500 lbs increased $10.70 from 1996 to $64.50 per cwt, while calf prices rebounded $22.50 to average $84.70 per cwt in 1997. The average price received for cattle over 500 lbs was still below the 1994 average price of $71.60 per cwt while calves are slightly higher than the $83.30 received in 1994.

Hog and pig cash receipts decreased 7 percent from 1996 to $34 million. The decrease was mainly due to lower hog marketings that totaled 277,000 head in 1997, down 19 percent from the previous year. Hog prices for 1997 were $5.60 higher at $55.30 per cwt. Cash receipts from the sales sheep and lambs was $30 million, up 5 percent from 1996. Marketings for sheep and lambs in 1997 were 68,000 and 300,000 head, respectively. The average price for sheep rose $6.20 per cwt to $37.40 per cwt and the average lamb price increased $6.70 to $97.80.

United States total 1997 cash receipts from marketings of meat animals rose 12 percent to $49.9 billion. Cattle and calves accounted for 72 percent of this total, hogs and pigs 27 percent, and sheep and lambs 1 percent. Production increased for hogs and pigs and sheep and lambs, but declined slightly for cattle and calves. Average prices rose from 1996 levels for all three species.

Cash receipts from marketings of cattle and calves in the United States increased from $31.1 billion in 1996 to $36.1 in 1997, a 16 percent increase. All cattle and calf marketings totaled 57.2 billion pounds in 1997, up 2 percent from last year. The U.S. annual average price per 100 pounds live weight for cattle was $63.10, an increase of $4.40 from the $58.70 in 1996. For calves, the annual average price increased $20.50 to $78.90.

United States hog and pig cash receipts totaled $13.2 billion during 1997, up 4 percent from 1996. Marketings increased to 24.3 billion pounds in 1997, up 1 percent from 1996. The U.S. annual average price per 100 pounds live weight rose from $51.90 in 1996 to $52.90 in 1997.

Cash receipts from marketings of sheep and lambs in United States during 1997 were $635 million, up 4 percent from 1996. Marketings declined slightly to 782 million pounds. The U.S. annual average price per 100 pounds live weight for lambs increased from $82.20 in 1996 to $90.30 in 1997 while for sheep, the annual average price increased $8.00 to $37.90.

U.S. Cattle on Feed Down 3 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.11 million head on April 1, 1998. The inventory was 3 percent below April 1, 1997, but 3 percent above April 1, 1996. The inventory included 6.18 million steers and steer calves, down 3 percent from the previous year. This group accounted for 61 percent of the total inventory. Heifers and heifer calves accounted for 3.88 million head, down 2 percent from 1997.

Placements in feedlots during March totaled 1.71 million, 13 percent below 1997 and 12 percent below 1996. Net placements were 1.61 million. During March, placements of cattle and calves weighing less than 600 pounds were 223,000, 600-699 pounds were 447,000, 700-799 pounds were 606,000, and 800 pounds and greater were 432,000. Marketings of fed cattle during March totaled 1.87 million, 6 percent above 1997 and 7 percent above 1996. Other disappearance totaled 94,000 during March, 9 percent above 1997 and 24 percent above 1996.

Montana March Red Meat Production Unchanged, But U.S. Red Meat Production Up

Montana slaughter plants produced 1.1 million pounds, dressed weight, of red meat during March, the same as March 1997, but 3 percent less than last month. There were 1,200 head of cattle slaughtered, unchanged from a year ago. The average live weight of cattle slaughtered increased 17 pounds to 1,160 pounds.

Hog kill in March totaled 1,800 head, 100 head more than March 1997. The average live weight decreased 10 pounds to 210 pounds. There were 100 head of sheep slaughtered in March, the same as a year ago at this time. The average live weight of sheep slaughtered increased 2 pounds to 126 pounds.

Commercial red meat production for the United States totaled 3.73 billion pounds in March, up 8 percent from the 3.44 billion pounds produced in March 1997. Beef production, at 2.08 billion pounds, was 6 percent above the previous year. Cattle slaughter totaled 2.89 million head, up 1 percent from 1997. The average live weight was up 39 pounds from the previous year at 1,200 pounds.

Veal production totaled 23.0 million pounds, 18 percent below March a year ago and 8 percent below the previous record low for March set in 1991. Calf slaughter totaled 127 thousand head, down 3 percent from March 1997. The average live weight was 295 pounds.

Pork production totaled 1.60 billion pounds, up 12 percent from the previous year. Hog kill totaled 8.48 million head, 12 percent above 1997. The average live weight was 1 pound above the previous year at 257 pounds.

Lamb and mutton production, at 26.0 million pounds, was up slightly from March 1997. Sheep slaughter totaled 386 thousand head, 3 percent below last year. The average live weight was 137 pounds, up 4 pounds from March a year ago.

January-March red meat production was 11.0 billion pounds, 6 percent above the comparable figure a year earlier. Accumulated beef production was up 2 percent from last year, veal was down 20 percent, pork was up 12 percent, and lamb and mutton was up 1 percent.

Montana Potato Stocks Up 5 Percent, U.S. Down 13 Percent

Montana potato producers held 2 million cwt of potatoes in storage on April 1, up 5 percent from the same time period last year. The amount in storage accounts for 60 percent of 1997 production compared with 59 percent held a year earlier.

Stocks are the quantity (whether sold or not) remaining in storage for all purposes and uses, including seed potatoes not yet moved and shrinkage, waste, and other losses that occur after the date of each report. Sales of fall potatoes for all purposes for the past 5 years averaged 90.5 percent of the total fall production. Shrinkage, loss, and home use account for the remaining 9.5 percent. Most seed for use the following year is on hand but remains as part of stocks until planted.

United States April 1, 1998, potato stocks totaled 129 million cwt, down 13 percent from a year earlier but 11 percent above two years ago. Disappearance was 278 million cwt, 6 percent below a year ago but up less than 1 percent from two years ago. Processing accounted for 137 million cwt through March, 8 percent less than last year and 2 percent short of two years ago. Seasonal shrink and loss of 24.5 million cwt was down 14 percent from last year.

Disappearance from the start of harvest to April 1 was 278 million cwt this season, down 6 percent from the same period a year earlier and less than 1 percent above two years ago. Disappearance during March was 41.0 million cwt, down 1 percent from last year but 4 percent above two years ago. Seasonal shrink and loss was estimated at 24.5 million cwt, down 14 percent from last year and 9 percent below two years ago.

Processing of 1997 crop potatoes totaled 137 million cwt so far this season, down 8 percent from last year and 2 percent below two years ago. March processing claimed 19.5 million cwt of potatoes, up 4 percent from last year and 8 percent above two years ago.

Western States held 97.9 million cwt of potatoes in storage on April 1, 1998, down 10 percent from last year but 12 percent above 1996. Idaho's stocks fell 9 percent from a year ago but were 3 percent above two years ago. Idaho's storage held more than half of the western stocks. Colorado's stocks were down 15 percent, Oregon's stocks were off 26 percent from last year, and California's stocks dropped 6 percent. Washington's stocks were off 2 percent from last year. Each of the Western States, except California, had more potatoes in storage than two years ago.

Montana Quarterly Milk Production Down, While U.S. March Milk Production Up

During the January-March quarter, Montana milk cows produced 72 million pounds of milk, down 2 million from the same quarter a year ago. Montana milk cow numbers are down 1,000 head from last year to 18,000 head.

Grain and other concentrates fed to Montana's milk cows on April 1 averaged 18.2 pounds per day, up 1.7 lbs. from a year earlier. The value of grain and other concentrates fed to cows on April 1 averaged $8.10 per cwt, up 20 cents from April 1, 1997.

Milk production in the 20 major States during March totaled 11.8 billion pounds, up 1.4 percent from production in these same States in March 1997. February revised production, at 10.4 billion pounds, was up 1.1 percent from February 1997.

Production per cow in the 20 major States averaged 1,529 pounds for March, 29 pounds above March 1997. The number of cows on farms in the 20 major States was 7.73 million head, 38,000 head less than March 1997 and 1,000 head less than February 1997.

The January-March quarterly production of milk for the U.S. was 39.3 billion pounds, 0.8 percent above the January-March period last year. The average number of milk cows in the U.S. during the January-March quarter was 9.18 million head, 111,000 head less than the same period last year.

Grain and other concentrates fed to milk cows on April 1, 1998, averaged 19.8 pounds, up 0.3 pounds from April 1, 1997, and unchanged from January 1, 1998. The value of grain and other concentrates fed to milk cows on April 1, 1998, averaged $8.36 per hundredweight, $0.43 less than April 1, 1997.

March Egg Production Up 3 Percent

U.S. egg production totaled 6.83 billion during March 1998, up 3 percent from the 6.62 billion produced in 1997. Production included 5.77 billion table eggs and 1.06 billion hatching eggs, of which 999 million were broiler-type and 62.0 million were egg-type. The total number of layers during March 1998 averaged 313 million, up 3 percent from the total average number of layers during March 1997. March egg production per 100 layers was 2,183 eggs, up slightly from March 1997.

All layers in the U.S. on April 1, 1998, totaled 313 million, up 3 percent from a year ago. The 313 million layers consisted of 255 million layers producing table or commercial type eggs, 54.8 million layers producing broiler-type hatching eggs, and 2.66 million layers producing egg-type hatching eggs. Rate of lay per day on April 1, 1998, averaged 71.3 eggs per 100 layers, up 1 percent from the 70.4 a year ago.

Laying flocks in the 30 major egg production States produced 6.47 billion eggs during March, up 3 percent from March 1997. The average number of layers during March, at 296 million, was up 3 percent from a year earlier.

Prospective Plantings
Quarterly Grain Stocks
Ag Prices Received Hogs & Pigs

March 1998 Prospective Plantings

Montana spring wheat producers expect to seed 3.9 million acres. If expectations hold this would be down 10% from last year, but would still be the fourth largest seeding on record. Lower prices and lack of moisture are holding producers back from seeding as many acres as the last couple of years. **Winter wheat** seedings remained unchanged from December at 1.4 million acres, down 200,000 from last year and the smallest plantings since 1941. Better prices are expected to cause **durum wheat** acreage to increase to 450,000 acres. If realized, this would be up 55% from last year and the largest durum wheat acreage seeded since 1981. Adding the winter wheat that has been seeded with other spring wheat and durum intentions would total 5.75 million acres of all wheat planted, down 8% from 1997's crop.

Barley intentions are estimated at 1.4 million acres, up 8% from last year, but intended **oats** acreage is estimated at 140,000 acres, unchanged from 1997. **Corn** intentions are estimated at 60,000 acres unchanged from last year. **Sugar beet** acreage is estimated at 63,200 acres, up 6% from 1997. **Dry bean** intentions are down 18% at 10,000 acres. An estimated 2.4 million acres of **hay** are to harvested, down 8% from 1997.

At the **U.S.** level, **winter wheat** seeded area for this year remains at 46.6 million acres, down 4% from 1997. Of the total, about 32.6 million acres are hard red winter, 10.0 are soft red and 4.0 are white winter. Several states ranging from Arkansas to South Carolina did not get all of the previously intended winter wheat in because of wet weather, but a few soft red states got a little more planted than originally expected.

Durum wheat seeded area for 1998 should total 4.08 million acres, up 25% from 1997 to the highest level since 1982. Favorable prices relative to other spring wheat have pushed acreage expectations in both North Dakota and Montana. **Other spring wheat** producers plan to seed 16.3 million acres this year, down 16% from last year's high level and at the lowest total since 1988. About 15.4 million of the prospective acres are hard red spring and white spring would be about 910,000 acres. Scab has plagued Minnesota fields five of the last six years. With the low prices growers are turning to other crops. North Dakota's acreage is down dramatically from last year. Downward price pressure has all but removed spring wheat from the Red River Valley. The 1997 South Dakota hard red spring acreage included more than 200,000 acres of abandoned winter wheat seeded to spring; this year's intentions are in the low-normal acreage range.

U.S. barley growers intend to seed 6.78 million acres for 1998, down 2% from the 6.91 million acres seeded a year ago. Barley growers in Minnesota and North Dakota who have in recent years suffered with scab disease problem are decreasing seedings by 120,000 and 100,000 acres respectively.

Oats acreage seeded and to be seeded by U.S. farmers for the 1998 crop year is expected to total 5.15 million acres, down fractionally from last year's final seeded acres. If producers meet their expectations, acreage seeded would be the second lowest recorded since 1866, exceeding only the 1996 acreage of 4.66 million acres. Growers expect to harvest 3.06 million acres for grain in 1998, up 5% from 1997. If intentions are realized, this would be the fourth smallest acreage harvested for grain on record.

U.S. dry bean farmers intend to plant 1.94 million acres of dry beans in 1998, up 5% from both last year and two years ago.

Area planted to **sugar beets** nationwide is expected to total 1.5 million acres in the 12 producing states. If growers' intentions are realized, planted acreage will be 2.6% above last year.

U.S. corn growers intend to plant 80.8 million acres of corn for all purposes in 1998, up 1% from last year and 2% from 1996. If these intentions materialize, this would be the largest planted acreage since 1985.

All hay producers expect to harvest 60.7 million acres of hay in 1998, compared with 60.8 million acres in 1997.

Agricultural Prices Received for February

The Montana winter wheat average price decreased 9 cents from January 1998 to $3.26 per bushel, durum wheat was down 23 cents to $5.08 per bushel, and spring wheat decreased 9 cents to $3.41 per bushel. Feed barley is down 7 cents per bushel to $2.07, but malt barley increased 7 cents to $3.02 per bushel. The all wheat price for mid-March averaged $3.53 per bushel and the all barley price for mid-March was $2.54. The price for alfalfa hay in March, was $71.00 per ton, down $3.00 from last month. The March other hay price of $63.00 also dropped $3.00 from February.

Livestock prices for the full month of February were mixed. Steer and heifer prices decreased $1.70 to $79.80 per cwt. Cows increased $2.00 to $37.30 and the average price for calves fell $1.50 to $89.60 per cwt. Sheep prices increased 90 cents to $39.90 per cwt but, lambs decreased $10.70 to $77.10 per cwt. Milk prices increased 10 cents from last month to $14.40 per cwt. Steer and heifer prices for mid-March averaged $78.70 per cwt.

Nationally, the all wheat price for February averaged $3.27 per bushel, down 6 cents from January. The all barley price averaged $2.39 per bushel, down 2 cents. Steer and heifer prices were down $2.80 to $63.30 per cwt. Cow prices were $36.00 and hog prices were $35.70 per cwt. Egg prices were 64.7 cents per dozen.

The All Farm Products Index of Prices Received in March was 103 based on 1990-92=100, up 2 points (2.0 percent) from February. Price increases from February for oranges, onions, lettuce, and cattle more than offset price decreases for tomatoes, strawberries, milk, and soybeans. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Higher seasonal marketings of tomatoes, soybeans, asparagus, and broilers more than offset the relatively lower marketings of cattle, cotton, corn, and oranges. These changes contributed one point of the two point increase in the overall index.

Compared with March 1997, the All Farm Products Index was 5 points (4.6 percent) lower. Price decreases from March 1997 for hogs, soybeans, cattle, and corn more than offset price increases for milk, onions, cauliflower, and calves.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Feb. 1997	Mar. 1997	Feb. 1998	Mar. 1998

U.S. Hog Inventory Up 8 Percent

U.S. inventory of all hogs and pigs on March 1, 1998, was 60.1 million head. This was 8 percent above March 1997, but 1 percent below December 1, 1997. Breeding inventory, at 6.99 million head, was up 2 percent from March 1, 1997 and unchanged from December 1, 1997. Market hog inventory, at 53.1 million head, was 8 percent above last year, but 2 percent below last quarter.

The December 1997-February 1998 U.S. pig crop, at 25.2 million head, was 8 percent more than 1997 and 9 percent more than 1996. Sows farrowing during this period totaled 2.90 million head, 7 percent above last year. The sows farrowed during this quarter represented 41 percent of the breeding herd. The average pigs per litter continues to increase, with an average of 8.68 pigs saved per litter for the December-February period. Last year the litter rate averaged 8.61 pigs. Pigs saved per litter by size of operation ranged from 7.10 for operations with 1-99 hogs to 8.90 for operations with more than 5,000 hogs and pigs.

U.S. hog producers intend to have 3.04 million sows farrow during the March-May 1998 quarter, 3 percent above the actual farrowings during the same period in both 1997 and 1996. Intended farrowings for June-August 1998, at 3.00 million sows, are 1 percent above the same period last year and 9 percent above 1996.

The total number of hogs under contract, owned by operations with over 5,000 head, but raised by contractees, accounted for 26 percent of the total U.S. hog inventory.

Montana Farm Real Estate Values Rise 5 Percent

The January 1, 1998 Montana farm real estate values, including land and buildings, were estimated at $320 per acre. This is a 5 percent increase over the previous year's value of $305 per acre. In the last 10 years the average Montana farm real estate value has grown from $200 to $320 per acre, an increase of 60 percent.

The January 1, 1998 U.S. farm real estate value, including land and buildings, reached a new record high of $1,000 per acre. For the second straight year farm real estate value rose 6 percent, continuing the climb that began in 1987. Since 1987 the average U.S. farm real estate value has grown from $599 to $1,000 per acre, an increase of 67 percent.

Regional increases in the values of farm real estate during 1997 ranged from 3 to 9 percent. The Northeast region with its urban influences had the highest average value of land and buildings, at $2,676 per acre, up 3 percent over the previous year. The Corn Belt, at $1,869 per acre, showed the largest percentage gain at 9 percent from 1997 and surpassed the prior all time high of $1,776 for the region set back in 1981. The Lake region also exceeded its previous high of $1,243 set back in 1981 with a new high of $1,288 per acre. The Southeast and Northeast regions showed the lowest increase at 3 percent each, while the remaining regions rose 4 to 8 percent. All states showed increases from the previous year except for Vermont and New York which remained steady.

Since 1990, the Corn Belt and Mountain regions have shown the largest real estate value gains at 68 and 59 percent, respectively. The Southern Plains, at 27 percent, had the least amount of gain during the decade. However, the 1998 Southern Plains $640 per acre is at the second highest level behind the $675 per acre set in 1985.

1997 Montana Red Meat Production Down

Montana slaughter plants produced 15.3 million pounds, dressed weight, of red meat during 1997, compared with 18.1 million pounds in 1996. There were 17,900 cattle slaughtered during 1997, down 14 percent from the previous year. The total live weight of 20.2 million pounds was down 16 percent from a year earlier. The average live weight was down 39 pounds to 1,126 pounds.

There were 20,100 hogs slaughtered in Montana, a decrease of 2,400 head from 1996. Total live weight of 4.4 million pounds was down 13 percent from 1996. The average live weight was 220 pounds per head compared with 227 the previous year. Sheep slaughter amounted to 2,800 head, a decrease of 100 head from a year earlier. The average live weight of 124 pounds was 9 pounds higher than the previous year. Total live weight of all sheep and lambs slaughtered in 1997 increased 14,000 pounds from 1996 to 346,000 pounds.

The number of Montana federally inspected slaughter plants on January 1, 1998 was 14, down 1 from 1997. There were 34 non-federally inspected plants on January 1, 1998, down 2 from the same date a year ago.

Red meat production in commercial plants and on farms for the United States during 1997 totaled 43.4 billion pounds, just above last year's figure and 1 percent below the record high set in 1995. Production included beef, veal, pork, and lamb and mutton slaughtered in commercial plants and on farms. Red meat production in commercial plants totaled 43.2 billion pounds. Lamb and mutton production was down 3 percent from the previous record low set in 1996. Beef production, at 25.5 billion pounds, was just below last year's figure. Veal production was down 12 percent at 333 million pounds. Pork production rose 1 percent to 17.3 billion pounds, while lamb and mutton production fell 3 percent to 260 million pounds.

Commercial cattle slaughter during 1997 totaled 36.3 million head, down 1 percent from 1996, with federal inspection comprising 97.9 percent of the total. The average live weight was 1,173 pounds, up 4 pounds from last year. Steers comprised 48.3 percent of the total federally inspected slaughter, heifers 31.7 percent, dairy cows 8.2 percent, other cows 9.8 percent, and bulls 1.9 percent. Commercial calf slaughter totaled 1.58 million head, down 11 percent from a year ago with 97.4 percent under federal inspection. The average live weight was 338 pounds, down 5 pounds from a year ago.

Commercial hog slaughter totaled 92.0 million head, down slightly from a year earlier, with 98.1 percent under federal inspection. The average live weight rose 2 pounds from the previous year to 256 pounds. Barrows and gilts comprised 96.0 percent of the total federally inspected total. Commercial sheep and lamb slaughter, at 3.91 million head, was down 7 percent from 1996 with 96.5 percent comprised by federal inspection. The average live weight rose 5 pounds from 1996 to 133 pounds.

There were 966 slaughtering plants under federal inspection included in this report compared with 954 last year. Of these, 822 slaughtered at least one head of cattle and 14 slaughtered 50 percent of the total head. There were 770 plants that slaughtered hogs, with 10 accounting for over 40 percent of the total. Likewise, 11 of the 355 plants that slaughtered calves accounted for over 50 percent of the total and 3 of the 571 plants that slaughtered sheep or lambs in 1997 comprised 50 percent of the total head.

PLEASE RETURN

February Red Meat Production

Montana slaughter plants produced 1.1 million pounds, dressed weight, of red meat during February 1998, down 6 percent from February 1997, and down 12 percent from the previous month. Cattle slaughter totaled 1,300 head, 100 head less that a year ago. The average live weight, at 1,144 pounds, was up 29 pounds from last year.

During February, there were 1,500 hogs slaughtered, the same as a year ago. The average live weight, at 206 pounds was 18 pounds less than last year. The number of sheep slaughtered, at 100 head was the same as the previous year. The average live weight increased 7 pounds from last February to 127 pounds.

Commercial red meat production for the United States totaled 3.48 billion pounds in February, up 6 percent from the 3.28 billion pounds produced in February 1997. Beef production, at 1.98 billion pounds, was 3 percent above the previous year. Cattle slaughter totaled 2.75 million head, down 2 percent from 1997. The average live weight was up 42 pounds from the previous year, at 1,204 pounds.

Veal production totaled 21.0 million pounds, 21 percent below a year ago and 5 percent below the previous record low for February set in 1993. Calf slaughter totaled 113 thousand head, down 10 percent from February 1997. The average live weight was 40 pounds below last year, at 308 pounds.

Pork production totaled 1.46 billion pounds, up 11 percent from the previous year and up 3 percent from the previous record high for February set in 1996. Hog kill totaled 7.7 million head, 11 percent above 1997 . The average live weight was 2 pounds above the previous year, at 258 pounds.

Lamb and mutton production, at 21.0 million pounds, was down 3 percent from February 1997 and equaled the previous record low for February set in 1979 and 1997. Sheep slaughter totaled 309 thousand head, 6 percent below last year. The average live weight was 136 pounds, up 3 pounds from February a year ago.

January-February red meat production was 7.31 billion pounds, 4 percent above the comparable figure a year earlier. Accumulated beef production was unchanged from last year, veal was down 22 percent, pork was up 12 percent, and lamb and mutton was up 2 percent.

1997 Montana and U.S. Wool Production Down

Montana wool growers produced 3.8 million pounds of wool during 1997, down 8 percent from 1996. The 1997 average price per pound of wool increased 7 cents to $1.01 per pound. The value of all wool produced was $3.9 million, a slight decrease from the previous year. The total head shorn decreased 7 percent to 402,000 head. The average fleece weight dropped from 9.6 pounds in 1996 to 9.5 pounds in 1997.

Shorn wool production in the United States during 1997 was 53.9 million pounds, down 5 percent from 1996. Sheep and lambs shorn totaled 7.03 million head, a decrease of 3 percent from 1996. The average price paid for wool sold in 1997 was $0.84 per pound for a total value of $45.2 million, up 14 percent from $39.7 million in 1996. The average fleece weight dropped from 7.8 pounds in 1996 to 7.7 pounds in 1997.

U.S. February Milk Production Up 1.3 Percent

Milk production in the 20 major States during February totaled 10.5 billion pounds, up 1.3 percent from production in these same States in February 1997. January revised production, at 11.3 billion pounds was up 1.4 percent from January 1997.

Production per cow in the 20 major States averaged 1,353 pounds for February, 25 pounds above February 1997. The number of cows on farms in the 20 major States was 7.73 million head, 45,000 head less than February 1997 and 1,000 head less than January 1997.

U.S. Cattle on Feed Up 1 Percent

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.37 million head on March 1, 1998. The inventory was 1 percent above March 1, 1997 and 7 percent above March 1, 1996.

Placements in feedlots during February totaled 1.45 million, 19 percent below 1997 and 15 percent below 1996. Net placements were 1.39 million. During February, placements of cattle and calves weighing less than 600 pounds were 210,000, 600-699 pounds were 434,000, 700-799 pounds were 501,000, and 800 pounds and greater were 309,000.

Marketings of fed cattle during February totaled 1.81 million, slightly above 1997 but 2 percent below 1996. Other disappearance totaled 69,000 during February, 13 percent above 1997 but 4 percent below 1996.

Montana Potato Stocks Up 7 Percent

Montana potato producers held 2.89 million cwt in storage on March 1, 7 percent more than held a year earlier. The March 1 stocks represented 87 percent of the 1997 production compared with 84 percent of the crop held a year earlier. This season's disappearance from the start of harvest to March 1 was 438,000 cwt, down 15 percent from the same period last year.

March 1, potato stocks held by U.S. producers were estimated at 170 million cwt, down 10 percent from a year earlier, but 9 percent above two years ago. Disappearance was 237 million cwt, 7 percent below a year ago. Processing accounted for 118 million cwt through February, 9 percent less than last year and 3 percent short of two years ago. Seasonal shrink and loss of 22.4 million cwt was down 14 percent from last year.

Disappearance from the start of harvest to March 1 was 237 million cwt this season, down 7 percent from the same period a year earlier and less than 1 percent below two years ago. Disappearance during February was 35.5 million cwt, down 6 percent from last year but 7 percent above two years ago. Seasonal shrink and loss was estimated at 22.4 million cwt, down 14 percent from last year and 10 percent below two years ago.

Processing of 1997 crop potatoes totaled 118 million cwt so far this season, down 9 percent from last year and 3 percent below two years ago. February processing claimed 19.3 million cwt of potatoes, down 4 percent from last year but 9 percent above two years ago.
(Continued on back page)

1997 Montana Sheep and Lamb Losses Totaled $6 Million

Montana sheep & lamb producers lost 85,000 animals to weather, predators, disease and other causes during 1997, representing a total value of $6.0 million. The total number of sheep and lambs lost increased 2 percent from 1996 and the total value of inventory lost in 1997 rose 12 percent. High market prices in 1997 increased the value of sheep and lambs. The increase in sheep and lamb losses is due partly to severe spring snow storms that hit the eastern part of the state. To measure the impact of the sheep and lamb losses the January 1, 1997 inventory is added to the number of lambs born during 1997. Sheep and lamb death losses represented 10.1 percent of the January 1, 1997 inventory plus the lambs born during 1997 -- a slightly higher death loss percentage than the previous year.

Predators caused an estimated $1.8 million in losses in 1997 down from $1.9 million in 1996. Losses due to predators amounted to 3.2 percent of the January 1 inventory and lambs born and 32 percent of all sheep and lamb deaths. Coyotes remained the largest predator for both sheep and lambs. Coyotes accounted for 74 percent of the predator losses and 23 percent of all death losses in the state. The value of losses attributed to coyotes was $1.3 million, compared with 1.4 million last year. The number of sheep and lambs lost to all predators totaled 27,000 head, down 4,200 head from last year. Lamb losses by all predators amounted to 22,400 head, down 15 percent from last year. The number of sheep lost to all predators totaled 4,600, down 400 head from a year ago.

The total value of non-predatory losses was $3.6 million in 1997 compared with $2.6 million the previous year. Non-predatory losses accounted for 58 percent of all losses, compared with 47 percent in 1996. The largest non-predatory cause of losses was weather conditions at 26,200 head. Some producers commented that they lost a large portion of their flocks in April storms. Sheep losses to non-predatory factors totaled 17,800, 51 percent higher than 1996. Non-predatory lamb losses came in at 31,300 head, 14 percent higher than a year ago.

Fewer producers reported sheep and lambs lost to unknown causes this past year. This resulted in the number of sheep and lambs lost to unknown causes to decrease 29 percent from last year. Lambs lost to unknown causes totaled 6,300 head, 2,100 head lower than 1996. Unknown causes claimed 2,600 sheep, 1,600 less head than last year. The value of sheep and lambs lost to unknown causes decreased $.3 million to $.6 million.

Of the livestock producers surveyed, 26 percent reported receiving assistance from a government trapper during 1997. Producers reported that 61.9 percent used some forms of non-lethal predator control practices. Guard animals were the most popular practice reported. The survey found that 70.8 percent of these producers used guard animals and 82.6 percent of them reported the guard animals as very effective.

Montana Wool Growers Association provided funding for the 1997 sheep and lamb loss survey.

Montana Potato Stocks Up 7 Percent (continued from page 2)

Western States held 125 million cwt of potatoes in storage on March 1, 1998, down 8 percent from last year but 10 percent above 1996. Idaho's stocks fell 8 percent from a year ago but were 3 percent above two years ago.

Idaho's storage held more than half of the western stocks. Colorado's stocks were down 14 percent and Oregon's stocks were off 19 percent from last year, while California's stocks dropped 9 percent. Washington's stocks were off 2 percent from last year, while Montana's seed growers gained 7 percent. Each of the Western States, except California, had more potatoes in storage than two years ago.

February Egg Production Up 3 Percent

U.S. egg production was 6.07 billion during February 1998, up 3 percent from the 5.90 billion produced in 1997. Production included 5.12 billion table eggs and 950 million hatching eggs, of which 893 million were broiler-type an 57.0 million were egg-type. The average number of layers during February 1998 was 312 million, up 3 percent from the average number of layers during February 1997. February egg production per 100 layers was 1,946 eggs, up slightly from February 1997.

All layers in the U.S. on March 1, 1998, totaled 313 million, up 3 percent from a year ago. The 313 million layers consisted of 256 million layers producing table or commercial type eggs, 54.6 million layers producing broiler-type hatching eggs, and 2.68 million layers producing egg-type hatching eggs. Rate of lay per day on March 1, 1998, averaged 69.6 eggs per 100 layers, down fractionally from the 69.9 a year ago.

Laying flocks in the 30 major egg production States produced 5.76 billion eggs during February, up 3 percent from February 1997. The average number of layers during February, at 295 million, was up 2 percent from a year earlier.

MONTANA WHEAT AND BARLEY MOVEMENT

Wheat shipped to out-of-state destinations during the June-November 1997 period, at 56.9 million bushels, was 2 percent higher than the same period last year.

Shipments to eastern destinations totaled 3.8 million bushels, up 31 percent from the 2.9 million bushels last year. Movement to the west was 51.8 million bushels compared with 52.0 million from a year earlier. Other destinations, mostly to the south, received 1.2 million bushels up 2 percent from last year.

Rail movement amounted to 53.1 million bushels, 93 percent of total shipments, compared with 94 percent last year.

Barley shipped to out-of-state destinations, June-November 1997, was 11.9 million bushels, down 9 percent from the same period last year.

Eastern destination shipments totaled 2.3 million bushels down 14 percent from last year. Shipments to western destinations did not change from last year at 8.6 million bushels. Shipments to other destinations were down from last year's 1.9 million bushels to 1.1 million bushels this year.

Barley hauled by rail was 90 percent of total movement up from 85 percent for the same period last year.

1/ Counties with less than 500 acres planted of one class of wheat are combined into "other" counties to avoid disclosure of individual information.
2/ Planted acres less winter wheat acres replanted to spring wheat.

AGRICULTURAL PRICES RECEIVED FOR JANUARY

The Montana winter wheat average price decreased 24 cents from December 1997 to $3.35 per bushel, durum wheat was down 26 cents to $5.31 per bushel, and spring wheat decreased 25 cents to $3.50 per bushel. Feed barley was up 13 cents per bushel to $2.14, but malt barley decreased 19 cents to $2.95 per bushel. The all wheat price for mid-February averaged $3.61 per bushel and the all barley price for mid-February was $2.66. The price for alfalfa hay in February, at $74.00 per ton, was down $4.00 from last month. The February other hay price of $66.00 is unchanged from January.

Cattle prices for the full month of January were higher. Sheep and lamb prices were lower. Steer and heifer prices increased 90 cents to $81.50 per cwt. Cows increased $2.50 to $35.30 and the average price for calves rose $2.90 to $91.10 per cwt. Sheep prices decreased $1.50 to $39.00 per cwt and lambs decreased $8.00 to $87.80 per cwt. Milk prices decreased 20 cents from last month to $14.30 per cwt. Steer and heifer prices for mid-February averaged $80.20 per cwt.

Nationally, the all wheat price for January averaged $3.33 per bushel, down 12 cents from December. The all barley price averaged $2.37 per bushel, down 6 cents. Steer and heifer prices were down 70 cents to $66.10 per cwt. Cow prices were $34.50 and hog prices were $36.00 per cwt. Egg prices were 51.1 cents per dozen.

The All Farm Products Index of Prices Received in February was 100 based on 1990-92=100, down 3 points (2.9 percent) from January. Price decreases from January for cattle, eggs, corn, and lettuce more than offset price increases for broilers, tomatoes, onions, and oranges. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower seasonal marketings of corn, soybeans, tobacco, and cotton more than offset the relatively higher marketings of milk, cattle, broilers, and hogs. These changes contributed one point of the three point decrease in the overall index.

Compared with February 1997, the All Farm Products Index was 5 points (4.8 percent) lower. Price decreases from February 1997 for hogs, broilers, cattle, and corn more than offset price increases for milk, onions, potatoes, and calves.

MONTANA 1997 ALFALFA SEED PRODUCTION

Montana's 1997 alfalfa seed production was estimated at 3.54 million pounds, down 30% from 1996. Producers harvested 12,000 acres in 1997, up 500 acres from last year. Unfortunately, yields were much lower than a year ago. The state average yield was estimated at 295 pounds per acre, down from 440 pounds a year ago. Irrigated yields averaged 358 pounds per acre and non-irrigated yields averaged 80 pounds per acre. Producers used an average of 2 gallons of leaf cutter bees per acre on all acres harvested for alfalfa seed in 1997.

Proprietary varieties made up 72 percent of this year's production, up 11 points from 1996. Common uncertified varieties accounted for 25 percent of the production and common certified varieties made up the remaining 3 percent.

The average price received for the 1997 crop was $1.25 per pound, up 7 cents from 1996's average price.

HIGHLIGHTS:

1997 Crop Values
Farm Numbers & Land in Farms
January Red Meat Production
Farm Labor — Cattle on Feed
Milk Produciton — Egg Production
Honey Production — Potato Stocks

1997 CROP VALUES FALL

The value of Montana's 1997 all wheat crop fell more than 9 percent from 1996 to $682.5 million. Although total production was up nearly five percent, the season average price was down 44 cents per bushel. The 1997 season average price for all wheat was set at $3.80 per bushel compared with the 1996 price of $4.24.

The estimated value of Montana's winter wheat crop fell 27 percent from the previous year to $195.1 million. One of the smaller crops in recent history and a lower season average price resulted in the large decrease. Spring wheat's value of production, estimated at $450.7 million, was up just slightly from 1996. Although the season average price fell 52 cents to $3.70, increased production caused the total value of the crop to be higher. Durum wheat's season average price increased 40 cents from 1996 to $5.05. Total 1997 value of production was estimated at $36.8 million, up 13 percent from 1996.

Total value of production for barley was estimated at $181.3 million, up 14 percent from the previous year. The 1997 season average price, at $2.85, was down 22 cents from 1996. Much better production in 1997 resulted in the higher production value.

The season average price for all hay increased $1.00 from last year to $81.00 per ton. Increased production and a higher price resulted in the value of production increasing 14 percent to $431.9 million. Alfalfa hay's 1997 season average price was estimated at $82.00, up $1.00 from last year while other hay's season average price rose $3.50 to $70.50.

MONTANA 1997 FARM NUMBERS AND LAND IN FARMS

Montana's number of farms for 1997 was estimated at 24,000, up 1,000 from 1996's revised estimate of 23,000. Land in farms fell 100,000 acres to 59.6 million acres. The average size of farm is 2,483 acres.

The number of farms in the United States in 1997 is estimated at 2.06 million, down less than one percent from 1996. Total land in farms is 968 million acres, also down less than one percent from last year. This decline in farm numbers and land in farms continues to follow historical trends. The average farm size increased from 1996 to 471 acres.

The West and Northeast Regions were both up in farm numbers from 1996. The West Region showed the largest increase, up 2,000 farms or 0.7 percent, while the Northeast Region was up 300 farms or 0.2 percent from 1996. The largest decrease was in the North Central Region with a loss of 5,500 farms or 0.7 percent. The South Region was down 2,800 farms or 0.3 percent.

Texas remained the State with the most farms at 205,000, the same as a year earlier. Missouri was second with 102,000 farms, down 2,000 from last year, followed by Iowa with 98,000 farms, the same as 1996.

Eight States increased in farm numbers while 13 states decreased from a year ago. California showed the largest increase with 2,000 farms while Indiana, Montana, Ohio, and Oklahoma showed increases of 1,000 farms from last year. Missouri, Michigan, and Kansas showed the largest decreases, of 2,000 farms. Texas continued to lead the nation in land in farms and ranches with 129.0 million acres, the same as 1996. Arkansas, Louisiana, North Carolina and New Mexico all showed the largest decrease in agricultural land from a year ago, each decreasing 200,000 acres. There were nine states with decreases of 100,000 acres in agricultural land from a year ago. There were no states that increased acres in agricultural land in farms from a year ago.

The number of U.S. farms in the economic sales class between $1,000 and $9,999 increased from 1,020,110 in 1996 to 1,030,510 in 1997. Those with sales in the $10,000 - $99,999 group decreased from 705,100 in 1996 to 678,500 in 1997. The $100,000 and over sales group increased from 338,700 in 1996 to 348,900 farms in 1997.

RED MEAT PRODUCTION DOWN FOR MONTANA

Montana slaughter plants produced 1.3 million pounds, dressed weight, of red meat during January 1998, down 8 percent from last year, and down 5 percent from last month. Cattle slaughter, at 1,500 head, was 200 head less than from last year. The average live weight of 1,142 pounds was up 34 pounds from a year ago.

There were 1,600 head of hogs slaughtered in Montana during December, up 100 head from a year ago. The average live weight, at 208 pounds, dropped 16 pounds from last year. Sheep slaughter amounted to 200 head, unchanged from last year. The average live weight of 124 pounds was down 5 pounds.

U.S. commercial red meat production for the United States totaled 3.84 billion pounds in January, just above January's previous record of 3.82 billion pounds, set in 1996. Beef production, at 2.16 billion pounds, was down 3 percent from the previous year. Cattle slaughter totaled 3.04 million head, down 6 percent from 1996.

Continued on the next page

PLEASE RETURN

RED MEAT PRODUCTION (continued)

The average live weight was up 37 pounds from the previous year at 1,197 pounds.

Veal production totaled 24.0 million pounds, down 23 percent from a year earlier. Calf slaughter totaled 128,000 head, down 13 percent from the previous year. The average live weight was down 39 pounds from last year to 305 pounds.

Pork production totaled 1.63 billion pounds, up 12 percent from the previous year and 5 percent higher than the previous high for January set in 1996. Hog kill totaled 8.59 million head, up 11 percent from a year earlier. The average live weight was up 2 pounds from the previous year at 259 pounds.

Lamb and mutton production, at 21.0 million pounds, was up 6 percent from the previous year. Sheep slaughter totaled 309,500 head, up 2 percent from last year. The average live weight was 136 pounds, 5 pounds heavier than a year ago.

JANUARY EGG PRODUCTION UP 2 PERCENT

U.S. egg production totaled 6.74 billion during January 1998, up 2 percent from the 6.57 billion produced in 1997. Production included 5.69 billion table eggs and 1.05 billion hatching eggs, of which 987 million were broiler-type and 60.0 million were egg-type. The total average number of layers during January 1998 averaged 310 million, up 2 percent from the total average number of layers during January 1997. January egg production per 100 layers was 2,171 eggs, up slightly from January 1997.

All layers in the U.S. on February 1, 1998, totaled 310 million, up 2 percent from a year ago. The 310 million layers consisted of 253 million layers producing table or commercial type eggs, 54.9 million layers producing broiler-type hatching eggs, and 2.59 million layers producing egg-type hatching eggs. Rate of lay per day on February 1, 1998, averaged 69.4 eggs per 100 layers, up 1 percent from the 68.8 a year ago.

Laying flocks in the 30 major egg production States produced 6.38 billion eggs during January, up 2 percent from January 1997. The average number of layers during January, at 293 million, was up 2 percent from a year earlier.

U.S. HIRED WORKERS AND WAGES 6 PERCENT ABOVE A YEAR AGO

There were 802,000 hired workers on the Nation's farms and ranches during the week of January 11-17, 1998, up 6 percent from a year ago. There were 661,000 workers hired directly by farm operators. Agricultural service employees on farms and ranches made up the remaining 141,000 workers. Migrant workers accounted for 7.3 percent of the January hired workforce compared to 9.5 percent last year.

Farm operators paid their hired workers an average wage of $7.61 per hour during the January 1998 survey week, up 41 cents or 6 percent from a year earlier. Field workers received an average of $6.99 per hour, up 39 cents. Livestock workers earned $6.97 per hour compared with $6.52 a year earlier.

During the survey week of January 11-17, 1998, mild temperatures prevailed over most of the United States, except for early-week bitterly cold temperatures along the Northern Plains. New England farmers, especially dairymen, worked extended hours to recover from the previous week's severe ice storm. Field activities along the Pacific Coast were hampered again this week by an onslaught of storms bringing snow, ice, and rain. In northern California, over 4 inches of rain fell in many locations, halting fieldwork. However, spring vegetable crop seedbed preparation and planting continued where weather and soils permitted. The storms tracked eastward, bringing precipitation into the central and northern Rocky Mountains States.

MONTANA POTATO STOCKS UP 5 PERCENT

Montana potato producers held 3.0 million cwt. of potatoes in storage on February 1, up 5 percent from a year ago. The stocks represent 90 percent of the 1997 total production, compared with last year's stocks representing 89 percent of the 1996 total production.

Nationally, February 1, 1998, potato stocks totaled 206 million cwt, down 9 percent from a year earlier but 9 percent above two years ago. Disappearance was 201 million cwt, 7 percent below a year ago and off 1 percent from two years ago. Processing accounted for 98.6 million cwt through January, 10 percent less than last year and 5 percent short of two years ago. Shrink and loss of 20.5 million cwt was down 14 percent from last year. Stocks by type were 2 percent reds, 13 percent whites, and 85 percent russets, with more russets but fewer reds and whites than a year ago.

U.S. disappearance from the start of harvest to February 1 was 201 million cwt this season, down 7 percent from the same period a year earlier and 1 percent below two years ago. Disappearance during January was 35.0 million cwt, down fractionally from last year but 2 percent above two years ago. Seasonal shrink and loss was estimated at 20.5 million cwt, down 14 percent from last year and 10 percent below two years ago.

Processing of 1997 crop potatoes totaled 98.6 million cwt so far this season, down 10 percent from last year and 5 percent below two years ago. January processing claimed 15.5 million cwt of potatoes, down 6 percent from last year and 5 percent short of two years ago.

Western States held 149 million cwt of potatoes in storage on February 1, 1998, down 7 percent from last year but 10 percent above 1996. Idaho's stocks fell 7 percent from a year ago but were 3 percent above two years ago. Idaho's storage held more than half of the western stocks. Colorado and Oregon stocks were each off 16 percent from last year, while California's stocks dropped 4 percent. Washington's stocks were the same as last year and Montana's seed growers gained 5 percent. Each of the Western States, except California, had more potatoes in storage than two years ago.

MONTANA HONEY PRODUCTION UP 83 PERCENT

Montana's honey producers with five or more colonies produced 12.8 million pounds of honey in 1997, up 83 percent from the previous year. There were 107,000 colonies producing honey in 1997, compared with 117,000 colonies in 1996. The yield per colony increased 60 pounds from last year to 120 pounds per colony. The mild spring and summer contributed to the higher yield in contrast to the poor producing years of 1995 and 1996. Stocks on hand December 16, 1997, totaled 4.24 million pounds, up 132 percent from 1996.

Prices for the Montana honey crop averaged 74 cents per pound in 1997 compared with 88 cents per pound in 1996. The value of honey in 1997 was 9.5 million dollars, up 3.3 million dollars from the 1996 honey crop.

The **Nation's** honey production in 1997 from producers with five or more colonies totaled 192 million pounds, down 3 percent from 1996. There were 2.58 million colonies producing honey in 1997, compared with 2.56 million in 1996. Yield per colony averaged 74.6 pounds, down 2.7 pounds from the 77.3 pounds in 1996. Colonies which produced in more than one State were counted in each State and yields per colony may, therefore, be understated. Colonies were not counted if honey was not harvested. Producer honey stocks were 69.1 million pounds on December 15, 1997, up 47 percent from a year earlier.

Prices for the 1997 crop averaged 75.2 cents per pound, down 15 percent from the previous record price of 88.8 cents in 1996. Prices are based on retail sales by producers and sales to private processors and co-ops. At the State level, prices reflect the portions of honey sold retail, co-op and private. At the U.S. level, prices for each color are derived by weighting State average prices by the State quantities sold for each marketing channel. Co-op and Private prices were lower for all color classes in 1997. Prices for 1996 reflect sales of the 1996 honey crop in 1996 and 1997.

JANUARY MILK PRODUCTION UP 2 PERCENT

Milk production in the 20 major States during January totaled 11.4 billion pounds, up 2 percent from production in these same States in January 1997. December revised production, at 11.1 billion pounds was up 1 percent from December 1996.

Production per cow in the 20 major States averaged 1,473 pounds for January, 40 pounds above January 1997. The number of cows on farms in the 20 major States was 7.73 million head, 58,000 head less than January 1997 and 3,000 head less than December 1997.

U.S. CATTLE ON FEED UP 4 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.79 million head on February 1, 1998. The inventory was 4 percent above February 1, 1997 and 9 percent above February 1, 1996.

Placements in feedlots during January totaled 1.73 million, 9 percent below 1997 but 11 percent above 1996. Net placements were 1.63 million. During January, placements of cattle and calves weighing less than 600 pounds were 317,000, 600-699 pounds were 560,000, 700-799 pounds were 550,000, and 800 pounds and greater were 298,000.

Marketings of fed cattle during January totaled 2.00 million, 1 percent below 1997 but 3 percent above 1996. The year-to-year relationship between fed cattle marketed and commercial slaughter was affected by the decrease in cattle imported from Canada that are going directly to slaughter.

Other disappearance totaled 99,000 during January, 8 percent above 1997 and 52 percent above 1996.

CATTLE AND CALF INVENTORY DOWN SIGNIFICANTLY

Montana's cattle and calf inventory was 2.6 million head on January 1, 1998, down 4 percent from a year ago. This is the lowest inventory since 2.55 million head were on hand January 1, 1994. The largest declines in inventory numbers came from a 23 percent drop in calves weighing less than [illegible] lbs, a 13 percent drop in steer numbers, and a 2 percent decline in cows.

The number of beef cows that had calved, at 1.542 million head, was down 2 percent from January 1, 1997. The number of milk cows in the state dropped 10 percent from last year to 18,000 head. Some of the decrease in cow inventories can be attributed to higher cow prices in the spring and summer months. Some ranchers indicated they were getting out of the business or downsizing their herds. While cow inventories declined during the year, inventories of beef cow replacements, milk cow replacements, and other heifers were equal to or higher than a year earlier. Beef heifer replacements, weighing 500 pounds or more, were unchanged from the previous year at 350,000 head. Milk heifer replacements rose 1,000 head from the previous year to 8,000 head. Other heifers weighing 500 lbs or more, increased 2 percent from last year to 210,000 head.

Calves weighing less than 500 lbs, at 115,000 head dropped 23 percent from last year to a record low inventory for the state. Higher prices for calves and good to excellent grazing conditions during most of the year reduced the number of calves that weighed less than 500 pounds on January 1 compared with a year ago. Bulls weighing 500 pounds or more decreased 1 percent to 97,000 head. Cattle and calves on full feed that will be sent directly to slaughter were estimated at 80,000 head, down 6 percent from the last year.

During 1997, 1.51 million calves were born in Montana, down 2 percent from 1996. Calving conditions were not much better than the previous year as spring snowstorms contributed to higher than normal calf death losses. Cattle and calf death losses for 1997 will be published in the Meat Animal Production, Disposition and Income Report issued April 24, 1998.

All cattle and calves in the United States as of January 1, 1998, totaled 99.5 million head, 2 percent below the 101.5 million on January 1, 1997 and 4 percent below the 103.5 million two years ago. All cows and heifers that have calved, at 42.9 million, were 2 percent below the 43.6 million on January 1, 1997 and 4 percent below the 44.6 million two years ago. Beef cows, at 33.7 million, were down 2 percent from January 1, 1997 and 4 percent below two years ago. Milk cows, at 9.19 million, were down 1 percent from January 1, 1997 and 2 percent below two years ago.

The 1997 calf crop was estimated at 38.7 million, down 3 percent from 1996 and down 4 percent from 1995. Calves born during the first half of the year are estimated at 28.5 million, down 3 percent from both 1996 and 1995. The number of operations with cattle totaled 1,167,910 during 1997, down 2 percent from 1996 and 4 percent below 1995. Beef cow operations in 1997 were down 2 percent from 1996 and 3 percent below 1995. Milk cow operations were 8 percent below last year and 15 percent below two years ago.

U.S. CATTLE ON FEED UP 6 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 11.16 million head on January 1, 1998. The inventory was 6 percent above January 1, 1997 and 8 percent above January 1, 1996. The inventory included 6.80 million steers and steer calves, up 6 percent from the previous year. This group accounted for 61 percent of the total inventory. Heifers and heifer calves accounted for 4.30 million head, up 6 percent from 1997.

Placements in feedlots during December totaled 1.55 million, 8 percent below 1996 and 10 percent below 1995. Net placements were 1.47 million. During December, placements of cattle and calves weighing less than 600 pounds were 366,000, 600-699 pounds were 519,000, 700-799 pounds were 390,000, and 800 pounds and greater were 277,000.

Marketings of fed cattle during December totaled 1.75 million, 4 percent above 1996 and 5 percent above 1995. Other disappearance totaled 85,000 during December, 1 percent below 1996 but 25 percent above 1995.

SPECIAL THANKS to all livestock producers responding to our January 1 cattle and sheep inventory surveys. Field and telephone interviewers contacted about 2,000 Montana farmers and ranchers early in January. Names were selected on a statistical probability basis. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics for a more efficient production and marketing system.

JANUARY 1, 1998 SHEEP AND LAMB INVENTORY DOWN

Montana's sheep and lambs inventory set a new record low at 410,000 head, down 5 percent from last year. Producers continue to adjust inventories, but not as significantly as recent years. Predators and last spring's severe snow storms caused the industry considerable losses and reduced inventories in 1997. A detailed report on sheep and lamb losses will be published in mid-February.

Breeding sheep and lamb numbers declined 15,000 head from last year to 385,000 head. Producers seem to be stabilizing their flock sizes at about the same levels as last year. Ewes one year and older were down 5 percent to 315,000 head. The 1997 lamb crop was 380,000 head, a drop of 5 percent from January 1, 1997.

There were 25,000 market sheep and lambs on hand January 1--all but 1,000 head were market lambs. Of the total market lambs, 4 percent weighed less than 65 pounds, 17 percent weighed 65-84 pounds, 58 percent were in the 85-105 pounds weight group, and 21 percent were over 105 pounds. There were 2,200 sheep and lamb operations in Montana during 1997, unchanged from 1996.

All sheep and lamb inventory in the United States on January 1, 1998 totaled 7.62 million head, down 4 percent from 1997 and 10 percent below two years ago. Inventory has slowly declined since 1942 when all sheep and lambs inventory reached it's peak of 56.2 million head.

Breeding sheep inventory declined to 5.54 million head on January 1, 1998, down 5 percent from January 1, 1997's 5.85 million head. Ewes one year old and older, at 4.53 million head, were 6 percent below last year. Market sheep and lambs on January 1, 1998, totaled 2.08 million head, down slightly from January 1, 1997. Market lambs comprised 96 percent of the total. Twenty-three percent were lambs under 65 pounds, 15 percent were 65 - 84 pounds, 30 percent 85 - 105 pounds, 28 percent were over 105 pounds, and 4 percent were market sheep.

The 1997 lamb crop of 5.24 million head was down 1 percent from 1996. This compares with the previous record low of 5.28 million head set a year ago. The 1997 lambing rate was 108 per 100 ewes one year old and older on January 1, 1997, compared with 103 in 1996.

The number of operations with sheep during 1997 totaled 74,710, down 4 percent from 1996 and 8 percent from 1995.

AGRICULTURAL PRICES RECEIVED FOR DECEMBER

The Montana winter wheat average price increased 16 cents from November 1997 to $3.59 per bushel, durum wheat was down 21 cents to $5.57 per bushel, and spring wheat increased 18 cents to $3.75 per bushel. Feed barley dropped 28 cents per bushel to $2.01, but malt barley increased 2 cents to $3.14 per bushel. The all wheat price for mid-January averaged $3.52 per bushel and the all barley price for mid-January was $2.77. The price for alfalfa hay in January, at $78.00 per ton, is down $4.00 from last month. The January other hay price of $66.00 is down $4.00 from December.

Livestock prices for the full month of December were mixed. Steer and heifer prices decreased $1.30 to $80.60 per cwt. Cows increased 70 cents to $32.80 and the average price for calves rose $2.90 to $88.20 per cwt. Sheep prices increased $3.30 to $40.50 per cwt., while lambs increased $2.60 to $95.80 per cwt. Milk prices increased 30 cents from last month to $14.50 per cwt. Steer and heifer prices for mid-January averaged $79.50 per cwt.

Nationally, the all wheat price for December averaged $3.45 per bushel, down 5 cents from November. The all barley price averaged $2.43 per bushel, down 15 cents. Steer and heifer prices were down $1.20 cents to $66.80 per cwt. Cow prices were $33.00 and hog prices were $41.60 per cwt. Egg prices were 68.0 cents per dozen.

The All Farm Products Index of Prices Received in January was 103 based on 1990-92=100, down 2 points from December. Price decreases from December for hogs, tomatoes, cattle, and eggs more than offset price increases for corn, lettuce, broilers, and snap beans. The seasonal changes in the mix of commodities farmers sell also affect the overall index level; however, these changes were essentially offsetting in January.

Compared with January 1997, the All Farm Products Index was 5 points (4.6 percent) lower. Price decreases from January 1997 for hogs, wheat, broilers, and soybeans more than offset price increases for milk, calves, potatoes, and lettuce.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Dec. 1996	Jan. 1997	Dec. 1997	Jan. 1998

MONTANA 1997 EGG PRODUCTION DOWN 19 PERCENT

Montana chickens produced 88 million eggs during the year ending November 30, 1997, down 19 percent from last year. Our state averaged 293,000 layers in 1997, compared with 378,000 the previous year. The average production per layer on hand was 300 egg, up five percent from a year ago.

There were 390,000 total chickens on Montana farms and ranches on December 1, 1997, compared with 470,000 on hand last year. The December 1, 1997 inventory included 240,000 layers 20 weeks old, 45,000 between 13 and 20 weeks old, and 69,000 pullets 13 weeks and under. The total value of all chickens on December 1, 1997, was $1.25 million, down 17 percent from the previous December. The decline was due to the decline in inventory since the average value per bird was the same as last year at $3.20.

U.S. egg production during the year ending November 30, 1997 totaled 77.4 billion eggs, up 1 percent from the previous year's total of 76.3 billion eggs. Table egg production, at 65.4 billion eggs, increased 1 percent from 1996. Hatching egg production, at 12.0 billion eggs, increased 4 percent. Average Number of Layers Up 2 Percent: Layer numbers during 1997 averaged 303 million, up 2 percent from the year earlier. The annual average production per layer on hand in 1997 was 255 eggs, compared with the 1996 average of 256 eggs per layer.

The total number of chickens on hand on December 1, 1997 (excluding commercial broilers) was 403 million birds, up 4 percent from last year. Potential layers (layers 20 weeks old and older, plus pullets 13 weeks and older but less than 20 weeks) on hand December 1, 1997, totaled 345 million, up 3 percent from December 1, 1996. Of the 345 million potential layers, 90 percent were 20 weeks old and older and the remainder were pullets 13 weeks and older but less than 20 weeks.

The total value of all chickens on December 1, 1996 was $1.10 billion, up 7 percent from December 1,1996. The average value increased from $2.65 per bird on December 1, 1996 to $2.72 per bird on December 1, 1997.

ANNUAL CROP PRODUCTION --1997

Dry conditions during the fall of 1996 led winter wheat producers to plant the second smallest winter wheat crop since 1951. Montana's winter wheat acreage was estimated at 1.6 million acres, down 26 percent from last year. Winter kill caused many acres to be reseeded, but producers were able to harvest 1.45 million acres, down 27 percent from 1996. Adequate moisture at the beginning of the season and timely rains in most of the winter wheat producing areas set the stage for the fourth highest yield on record. Average yield was estimated at 39 bushels per acre, up 7 bushels from last year, for a total production of 56.55 million bushels which is down 11 percent from 1996.

Spring wheat acreage made up for the lost winter wheat acreage. Montana producers planted an estimated 4.35 million acres, up 150,000 from last year, and the largest spring wheat acreage planted since 1953 when other spring and durum wheat records were combined. The eastern third of the state suffered from some drought-like conditions early in the year, but the rest of the state had a fair growing season with timely moisture. Producers were able to harvest 4.2 million acres, up 100,000 from last year. Yields averaged 29 bushels per acre across the state, up 3 bushels from 1996, but down nearly 3 bushels from the last five-year average due mainly to lower yields in the eastern third of the state. Total production was estimated at 121.8 million bushels, up 14 percent from last year. This is the second largest crop on record only behind 1995's production, because of the large number of acres harvested.

Montana durum wheat growers planted 290,000 acres and harvested 280,000 acres, both unchanged from last year's revised acreage estimates. Droughty conditions reduced yields to an average 26 bushels per acre, up 1 bushel from last year, when drought-like conditions also occurred. Total production was estimated at 7.28 million bushels, up nearly 4 percent from last year.

Barley acreage in Montana was estimated at 1.3 million acres with harvested acreage set at 1.2 million acres, both unchanged from 1996. Average yields were set at 53 bushels per acre, up 10 bushels from last year. This is the second highest yield on record. Not as much barley is grown in the eastern portion of the state which kept yields up unlike spring wheat. Total production was estimated at 63.6 million bushels, up 23 percent from last year.

Oat production was estimated at 3.85 million bushels, nearly twice the amount produced last year. Producers harvested more acreage and had better yields than 1996. Planted acreage was estimated at 140,000 acres, up 40,000 from last year. Harvested acreage was set at 70,000 acres, up 20,000 from last year. Yields averaged 55 bushels per acre, up 15 bushels from last year.

Montana producers harvested 14,000 acres of corn for grain in 1997, down 1,000 acres from last year. The average yield was 135 bushels per acre, down 2 bushels from last year's record. Production decreased 8 percent from last year to 1.89 million bushels. Corn for silage acreage was estimated at 45,000 acres, up 6,000 acres from 1996. Yields averaged 21 tons per acre, the same as a year ago.

Sugar beet producers in Montana harvested an estimated 58,300 acres of beets this year, up 800 acres from a year ago. Yields decreased 1.6 tons from last year to average 21.0 tons per acre. Total production was estimated at 1.2 million tons, down 8 percent from 1996.

Montana dry bean growers produced an estimated 257,000 cwt. of dry beans in 1997. Production was up 22,000 cwt. from 1996. Growers harvested 11,700 acres with a yield of 22.0 cwt. per acre compared with last year's 10,300 acres harvested with a yield of 22.8 cwt. per acre.

Fall potato production in Montana totaled 3.33 million cwt., up 4 percent from last year. Producers harvested 10,400 acres compared with 10,200 in 1996. Yields increased 5 cwt. per acre from a year ago to 320 cwt.

All hay harvested in Montana was the same as last year at 2.6 million acres. All hay production was 5.48 million tons, up 11 percent or 560,000 tons from a year ago. Alfalfa hay harvested acreage was 1.65 million acres, down 50,000 acres from last season . The average yield was 2.4 tons per acre compared with 2.1 tons per acre in 1996. Other hay harvested acreage was 950,000 acres and the average yield was 1.6 tons per acre, 0.1 ton above last year.

Montana hay growers seeded an estimated 150,000 acres of alfalfa during 1997. New seedings include those mixed with a nurse crop, other forage, or direct seedings.

1997 SWEET CHERRY PRODUCTION

Montana production of sweet cherries in 1997 was estimated at 1,300 tons, up 600 tons from last year's crop. This year's crop was larger than previous years as some trees that were replanted after the 1989 freeze are now coming into production. Utilized production totaled 970 tons. The large crop was a factor on the amount culled. The average price was $965 per ton, down $455 from a year ago.

U.S. sweet cherry production in 1997 was estimated at 222,800 tons, up 44 percent from 1996. Utilized production totaled 220,400 tons. The U.S. average price was $1250 per ton, down $220 from a year ago.

MONTANA RED MEAT PRODUCTION DOWN WHILE U.S. RED MEAT PRODUCTION RECORD HIGH

Montana slaughter plants produced 1.3 million pounds, dressed weight, of red meat during December 1997, down 5 percent from last year, but up 12 percent from last month. Cattle slaughter, at 1,600 head, was unchanged from last year. The average live weight of 1,123 pounds was down 21 pounds from a year ago.

There were 1,800 head of hogs slaughtered in Montana during December, up 100 head from a year ago. The average live weight, at 212 pounds, dropped 16 pounds from last year. Sheep slaughter amounted to 300 head, up 100 head from last year. The average live weight of 122 pounds was up 7 pounds.

Commercial red meat production for the United States totaled 3.72 billion pounds in December, equaling the record high for the month set in 1994. Beef production, at 2.03 billion pounds, was up 4 percent from the previous year. Cattle slaughter totaled 2.88 million head, virtually unchanged from a year earlier. The average live weight was up 34 pounds from the previous year at 1,193 pounds.

Veal production totaled 26.0 million pounds, down 16 percent from a year earlier. Calf slaughter totaled 144,900 head, down 5 percent from the previous year. The average live weight was down 35 pounds from last year to 301 pounds.

Pork production, at 1.64 billion pounds, was up 15 percent from the previous year. Hog kill totaled 8.62 million head, up 13 percent from a year earlier. The average live weight was up 3 pounds from the previous year at 260 pounds.

Lamb and mutton production totaled 23.0 million pounds, up 4 percent from the previous year. Sheep slaughter totaled 348,500 head, matching last year's number. The average live weight was 136 pounds, 6 pounds heavier than a year ago.

January - December red meat production was 43.2 billion pounds, essentially unchanged at 100 percent of the comparable figure a year earlier. Accumulated beef production was unchanged from last year, veal was down 12 percent, pork was up 1 percent, and lamb and mutton was down 3 percent.

MONTANA JANUARY POTATO STOCKS UP 4 PERCENT, U.S. DOWN 8 PERCENT

Montana potato producers held 3.1 million cwt. of potatoes in storage on January 1, up 4 percent from a year ago. The stocks represent 93 percent of the 1997 total production, compared with last year's stocks representing 92 percent of the 1996 total production.

January 1, 1998 **U.S.** potato stocks totaled 241 million cwt, down 8 percent from a year ago but 8 percent above two years ago. Storage accounted for 59 percent of fall production, the same as a year earlier. Stocks by type were 2 percent reds, 15 percent whites, and 83 percent russets, with more russets and fewer whites and reds than a year ago.

Disappearance from the start of harvest to January 1 totaled 166 million cwt this season, down 8 percent from last year and 2 percent below two years ago. Carry-over from last year's record large crop and a shift to later maturing varieties for processing resulted in lighter disappearance. December's disappearance of 33.4 million cwt was 1 percent above the last 2 years. Shrink and loss of 18.2 million cwt was 14 percent below last year and 9 percent below two years ago.

Processing of 1997 crop potatoes so far this season totaled 83.1 million cwt, down 11 percent from the 1996 crop and 5 percent below the 1995 crop. In December, processors claimed 15.1 cwt of potatoes, down 2 percent from last year and 7 percent below two years ago.

Western States held 170 million cwt of potatoes in storage on January 1, 1998, down 6 percent from last year but 9 percent above 1996. Every State was below last year except Montana. Idaho's stocks declined 6 percent, Washington was off 1 percent, and Oregon dropped 12 percent from a year ago. Colorado's storage fell 15 percent, and California's stocks were down 7 percent.

MONTANA QUARTERLY MILK PRODUCTION DOWN, U.S. DECEMBER MILK PRODUCTION UP

During the October-December quarter, Montana milk cows produced 70 million pounds of milk, 7 million pounds less than the same quarter a year ago. Montana milk cow numbers, at 18,000 head, were 2,000 head less than a year ago.

Grain and other concentrates fed to Montana's milk cows on January 1 averaged 17.5 pounds per day, slightly lower than the 17.7 pounds per day a year earlier. The value of grain and other concentrates fed to cows on January 1, averaged $7.70 per cwt, down 70 cents from January 1, 1997.

Milk production in the 20 major States during December totaled 11.1 billion pounds, up 0.9 percent from production in these same States in December 1996. November revised production, at 10.6 billion pounds was up 1.0 percent from November 1996.

Production per cow in the 20 major States averaged 1,440 pounds for December, 22 pounds above December 1996. The number of cows on farms in the 20 major States was 7.72 million head, 46,000 head less than December 1996 and 2,000 head less than November 1997.

During the October-December period, milk produced in the U.S. was 38.2 billion pounds, 0.7 percent above the October-December period last year. The average number of milk cows in the U.S. during the October-December quarter was 9.20 million head, 98,000 head less than the same period last year.

Grain and other concentrates fed to milk cows on January 1, 1998, averaged 19.8 pounds, up 0.6 pounds from January 1, 1997, and up 1.1 pounds from October 1, 1997. The value of grain and other concentrates fed to milk cows on January 1, 1998, averaged $8.47 per hundredweight, 32 cents less than January 1, 1997.

MONTANA SEEDED SMALLEST WINTER WHEAT CROP SINCE 1941

Low moisture conditions last fall caused Montana winter wheat producers to seed the smallest winter wheat crop since 1941. Winter wheat seedings totaled 1.4 million acres down 12 percent from last year's 1.6 million and 100,000 acres below 1995 when similar conditions existed. There have been concerns about the lack of snow cover this winter, as of December 31 eighty-seven percent of the seeded acreage had poor to very poor coverage.

Nationally, winter wheat planted area for 1998 harvest is estimated at 46.6 million acres. This is down 4 percent from last year to the lowest level since 1973. Planting got underway last August in the Pacific Northwest and several Mountain States. Progress moved forward at widely varying paces throughout the fall and should finish sometime next month in California. About 98 percent of the U.S. acreage was seeded by December 1.

Hard Red Winter (HRW) wheat seeded area is estimated at 32.5 million acres, down 5 percent from last year. Virtually all HRW states have planted less wheat. Oklahoma is the notable exception, unchanged from last season. In the rest of the Great Plains through Montana the declines total nearly 1.7 million acres. Emergence is spotty and lack of snow cover is raising fears of winterkill. Nebraska farmers have apparently planted the smallest crop in the state's history this fall. Wetness delayed Texas seeding; emergence and growth have been slow. Heavy winterkill the last two years has prompted some South Dakota growers to make other plans this year. What did get in is rated in good to excellent condition, but lack of snow cover is a concern. Colorado's crop entered dormancy in good condition. The Wyoming crop has felt minimal freeze and wind damage but snow cover is needed.

1997 LATE SEASON CROPS

Montana producers harvested 14,000 acres of **corn for grain** in 1997, down 1,000 acres from last year. The average yield was 135 bushels per acre, down 2 bushels from last year's record. Production decreased 8 percent from 1996 to 1.89 million bushels. Corn for silage acreage was estimated at 45,000 acres, up 6,000 acres from 1996. Yields averaged 21 tons per acre, the same as a year ago.

U.S. corn for grain production was estimated at 9.37 billion bushels, up less than 1 percent from the 1996 crop and virtually unchanged from the November 1 forecast. The 1997 production level ranks third behind 1994 and 1992, respectively. The U.S. yield of 127.0 bushels per acre was virtually the same as the 127.1 bushel yield of a year earlier.

Sugar beet producers in **Montana** harvested an estimated 58,300 acres this year, up 800 acres from a year ago. Yields decreased 1.6 tons from last year to average 21.0 tons per acre. Total production was estimated at 1.2 million tons, down 8 percent from the previous year.

U.S. production of sugar beets is expected to total 29.9 million tons in 1997, an increase of 12 percent from 1996 but a decrease of less than 1 percent from November. Area for harvest, at 1.43 million acres, is up 8 percent from last year but down fractionally from November. The average yield, at 20.9 tons per acre, is up 0.7 ton from 1996 but down 0.1 tons from November.

Montana dry bean growers produced an estimated 257,000 cwt. in 1997, up 22,000 cwt. from 1996. Growers harvested 11,700 acres with a yield of 22.0 cwt. per acre compared with last year's 10,300 acres harvested with a yield of 22.8 cwt. per acre.

U.S. production of dry edible beans is estimated at 29.2 million cwt for 1997, 4 percent above 1996 but 5 percent below two years ago. Area for harvest is estimated at 1.72 million acres, down 2 percent from 1996 and 9 percent below 1995. The average yield, at 1,695 pounds per acre, rose 100 pounds from 1996 and was the second highest yield on record. The record high yield of 1,764 pounds was set in 1991.

Fall potato production in **Montana** totaled 3.33 million cwt., up 4 percent from last year. Producers harvested 10,400 acres compared with 10,200 in 1996. Yields increased 5 cwt. per acre from a year ago to 320 cwt.

U.S. Production of fall potatoes in 1997 is estimated at 417 million cwt, down 8 percent from last year but 3 percent above two years ago. Area harvested, at 1.16 million acres, is off 7 percent from last year and 4 percent short of 1995. The average yield is estimated at 360 cwt per acre, down 4 cwt from last year but 26 cwt above two years ago.

All hay harvested in Montana was the same as last year at 2.6 million acres. All hay production was 5.48 million tons, up 11 percent or 560,000 tons from a year ago. Alfalfa hay harvested acreage was 1.65 million acres, down 50,000 acres from last season . The average yield was 2.4 tons per acre compared with 2.1 tons per acre in 1996. Other hay harvested acreage was 950,000 acres and the average yield was 1.6 tons per acre, 0.1 ton above last year.

Continued on back page.

The Montana crop acreage and grain stocks estimates in this issue of the Reporter are the result of surveying approximately 2,500 Montana farmers and ranchers during December. Names were selected on a statistical probability basis. SPECIAL THANKS to those operators that were interviewed and responded to the survey. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics.

DECEMBER 1, 1997 GRAIN STOCKS

All wheat stocks in Montana on December 1, 1997 totaled 149.3 million bushels, up 18% from the same quarter last year. Stocks stored on the farm accounted for 126.0 million bushels of the total with the remaining 23.3 million stored off farm. All spring wheat stocks, at 100.9 million bushels, was up 18% from last year and accounted for 68% of the total. Winter wheat stocks were estimated at 48.4 million, up 16% from last year. Durum wheat stocks were estimated at 5.6 million bushels, down 2% from last year. Barley stocks in all positions on December 1, 1997 were up 10% from last year and were set at 36.3 million bushels. Oat stocks on December 1, 1997 were up 36% from a year ago and were estimated at 3.47 million bushels.

Nationally, all wheat stocks in all positions on December 1, 1997 total 1.61 billion bushels, up 32 percent from a year ago. On farm stocks are 604 million bushels, up 3 percent from last December. Stocks off farm, at 1.01 billion bushels, are up 59 percent from last year. The indicated second quarter disappearance of 461 million bushels is down 9 percent from September-November, 1996.

U.S. durum wheat in all storage positions on December 1, 1997 was placed at 67.3 million bushels, down 22 percent from last December 1. The decrease is due to a much lower on-farm stocks total than last year. Off-farm stocks are up 51 percent. The indicated disappearance for the period September-November, 1997 was 20.4 million bushels.

Barley stocks in all positions on December 1, 1997 totaled 245 million bushels, down 1 percent from a year ago. Of the total barley stocks on hand, 136 million bushels were stored on farms, 1 percent below a year ago. December 1, 1997 off-farm stocks, at 109 million bushels, were 1 percent below last year. Indicated disappearance during the September-November quarter totaled 83 million bushels, 22 percent above the same period a year earlier.

Oats stored in all positions on December 1, 1997 is estimated at 144 million bushels, up 14 percent from the stocks December 1, 1996. Of the total stocks on hand, 83.4 million bushels were stored on farm, 3 percent above a year ago. Off-farm stocks totaled 60.8 million bushels, 34 percent above a last year. Indicated disappearance during the September-November quarter totaled 12.8 million bushels, compare to 6.2 million bushels for the same period in 1996.

See the District table on the back page.

1/ Terminals, mills, interior elevators. 2/ Montana stocks for winter wheat and all spring wheat are made possible through funds provided by the Montana Wheat & Barley Committee. 3/ Included in all spring wheat and all wheat. 4/ Not included in order to avoid disclosing individual operations. * Revised.

AGRICULTURAL PRICES RECEIVED FOR NOVEMBER

Montana winter wheat increased 10 cents to $3.43 per bushel, durum wheat increased 16 cents to $5.78 per bushel. Spring wheat went up 1 cent to $3.57 per bushel. Feed barley increased 19 cents per bushel to $2.29 and malt barley decreased 7 cents to $3.12 per bushel. The oats price is down 3 cents to $1.21 per bushel. The all wheat price for mid-December averaged $3.46 per bushel and the all barley price was $2.76. The price for alfalfa hay in December, at $82.00 per ton is up $1.00 from last month. The December other hay price is down $1.00 from November at $70.00 per ton.

Livestock prices for the full month of November were mixed. Steer and heifer prices increased $1.40 to $81.90 per cwt. Cows decreased $1.30 to $32.10 and the average price for calves fell $2.40 to $85.30 per cwt. Sheep increased $3.10 to $37.20 per cwt while lambs decreased $3.60 to $93.20 per cwt. Milk prices increased 40 cents from last month to $14.20 per cwt. Steer and heifer prices for mid-December averaged $81.20 per cwt.

Nationally, the all wheat price for November averaged $3.40 per bushel, down 15 cents from October. The all barley price averaged $2.41 per bushel, down 4 cents. Steer and heifer prices were up 20 cents to $67.50 per cwt. Cow prices were $31.90 and hog prices were $45.10 per cwt. Egg prices were 80.6 cents per dozen.

The All Farm Products Index of Prices Received in December was 104 based on 1990-92=100, down 3 points from November. Price decreases from November for wheat, corn, cotton, soybeans, lettuce, hogs, eggs, and poultry more than offset price increases for peanuts, rice, and strawberries. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower seasonal marketings of corn, peanuts, soybeans, grapes, cattle, and calves more than offset the relatively higher marketings of wheat, hay, tobacco, oranges, lettuce, hogs, and poultry.

Compared with December 1996, the All Farm Products Index was 6 points (5.5 percent) lower. Price decreases from December 1996 for wheat, corn, cotton, soybeans, oranges, lettuce, hogs, and poultry more than offset price increases for cattle, calves, strawberries, tomatoes, and potatoes.

1/ Composite of steers, heifers, and cows. 2/ Mid-month prices for sheep and lambs discontinued January 1996.

LATE SEASON CROPS (Continued from front page)

U.S. all hay production for 1997 was estimated at 152 million tons, down sightly from the October 1 forecast but 2 percent above the revised 1996 total. U.S. alfalfa hay production in 1997 totaled 79.2 million tons, up 1 percent from the October 1 forecast and essentially unchanged from the revised 1996 total. Declines in harvested acreage from the previous year were offset by higher yields in 1997.

All other hay production in the U.S. in 1997 totaled 72.9 million tons, down 1 percent from the October 1 forecast but up 4 percent from the revised 1996 total. An increase in both harvested acreage and average yields lead to the increased production.

MONTANA HAY STOCKS

Montana hay stocks were estimated at 5.04 million tons on December 1, up 8 percent from last year. Warmer temperatures and less snow led to reduced feeding of hay to livestock this fall. Stocks of all hay on farms in the U.S. on December 1, 1997 totaled 103 million tons, 2 percent below the stocks on farms December 1, 1996.

Montana hay growers seeded an estimated 150,000 acres of alfalfa during 1997. New seedings include those mixed with a nurse crop, other forage, or direct seedings. At the U.S. level, 3.74 million acres of alfalfa was newly seeded in 1997.

U.S. Cattle on Feed
Milk Production
Red Meat Production
Egg Production
Potato Stocks
December 1 Hog & Pig Inventory

U.S. CATTLE ON FEED UP 8 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 11.44 million head on December 1, 1997. The inventory was 8 percent above December 1, 1996.

Placements in feedlots during November totaled 2.21 million, 6 percent below 1996. Net placements were 2.12 million. During November, placements of cattle and calves weighing less than 600 pounds were 656,000, 600-699 pounds were 674,000, 700-799 pounds were 499,000, and 800 pounds and greater were 378,000.

Marketings of fed cattle during November totaled 1.67 million, 1 percent below 1996. Other disappearance totaled 85,000 during November, 9 percent below the previous year.

Cattle on Feed in Historic 7 States Up 8 Percent

Cattle on feed December 1, 1997, in the historic 7 States for feedlots with capacity of 1,000 or more head totaled 9.72 million, up 8 percent from the previous year and 12 percent above December 1, 1995.

Placements in feedlots during November totaled 1.83 million, 7 percent below 1996 but 1 percent above 1995. Marketings during November totaled 1.43 million, 1 percent above 1996 but 3 percent below 1995. Other disappearance during November was 69,000 head, 5 percent above 1996 and 13 percent above 1995.

20 STATE NOVEMBER MILK PRODUCTION UP 1.3 PERCENT

Milk production in the 20 major States during November totaled 10.6 billion pounds, up 1.3 percent from production in these same States in November 1996. October revised production, at 11.0 billion pounds was up 1.4 percent from October 1996.

Production per cow in the 20 major States averaged 1,377 pounds for November, 27 pounds above November 1996. The number of cows on farms in the 20 major States was 7.72 million head, 51,000 head less than November 1996 and 7,000 head less than October 1997.

MONTANA RED MEAT PRODUCTION DOWN, UNITED STATES UP

Montana slaughter plants produced 1.2 million pounds, dressed weight of red meat during November, down 9 percent from November 1996, and down 23 percent from the previous month. Cattle slaughter totaled 1,400 head, 100 head less than a year ago. The average live weight, at 1,107 pounds, was down 30 pounds from last year.

During November, there were 1,500 hogs slaughtered, unchanged from a year ago. The average live weight, at 226 pounds, was down 9 pounds from a year ago. The number of sheep slaughtered, at 200 head, was 100 head less than the previous year. The average live weight increased 10 pounds from last year to 126 pounds.

Commercial red meat production for the United States totaled 3.45 billion pounds in November, up 1 percent from the previous year. January - November red meat production was 39.5 billion pounds, essentially unchanged from a year earlier. Accumulated beef production was unchanged from last year, veal was down 12 percent, pork was equal to a year ago, and lamb and mutton was down 4 percent.

Beef production, at 1.94 billion pounds, was down 1 percent from the previous year. Cattle slaughter totaled 2.76 million head, down 4 percent from a year earlier. The average live weight was up 25 pounds from the previous year, at 1,188 pounds.

Veal production totaled 24.0 million pounds, down 21 percent from a year earlier. Calf slaughter totaled 125,300 head, down 13 percent from the previous year. The average live weight was down 28 pounds from last year to 313 pounds.

Pork production, at 1.47 billion pounds, was up 3 percent from the previous year. Hog kill totaled 7.74 million head, up 2 percent from a year earlier. The average live weight was up 3 pounds from the previous year at 260 pounds.

Lamb and mutton production totaled 20.0 million pounds, down 4 percent from the previous record low for November set in 1996. Sheep slaughter totaled 309,900 head, 8 percent below the previous year. The average live weight was 134 pounds, 7 pounds heavier than a year ago.

MONTANA POTATO PRODUCTION AND STOCKS UP 4 PERCENT

Montana producers planted and harvested 10,400 acres of potatoes during 1997. The planted acreage was the same as last year, but harvested acreage was up 200 from a year ago. The average yield was 320 cwt. per acre, 5 cwt. more than the 1996 average. Total production was 3,328,000 cwt, up 4 percent from a year ago.

Potato producers held 3,180,000 cwt. of potatoes in storage on December 1, 96 percent of total production, and 4 percent above last year. Last year's December 1 stocks accounted for 95 percent of total production.

The 15 major potato States held 274 million cwt. of potatoes on December 1, 1997, down 7 percent from last year but 7 percent above 1995. Storage accounted for 67 percent of 1997 fall production, the same as last year. Stocks by type were 3 percent red, 16 percent white, and 81 percent russet; more russets and fewer reds and whites are in storage than a year ago.

Disappearance in the 15 States from the start of harvest to December 1 was 133 million cwt. of potatoes, down 10 percent from the same period in 1996 and 3 percent less than 1995. Shrink and loss so far was estimated at 15.9 million cwt, down 14 percent from the 18.5 million cwt. lost in 1996 and 9 percent below the 17.4 million cwt. lost from the 1995 crop.

Processing of 1997 potatoes, to December 1, totaled 68.0 million cwt. This is down 13 percent from a year ago and 5 percent below two years ago.

Western States held 192 million cwt. of potatoes in storage on December 1, down 6 percent from a year ago but 8 percent above two years ago. Montana was alone among Western States with an increase in storage over last year. Colorado was down 14 percent, Oregon's storage was off 9 percent, Idaho's storage decreased 5 percent, California dropped 3 percent, and Washington stored 2 percent fewer potatoes than last year.

U.S. Production of fall potatoes in 1997 is estimated at 417 million cwt, down 8 percent from last year but 3 percent above two years ago. The December 1 forecast is down less than 1 percent from the November forecast. Area harvested, at 1.16 million acres, is off 7 percent from last year and 4 percent short of 1995. The average yield is estimated at 360 cwt. per acre, down 4 cwt. from last year but 26 cwt. above two years ago.

Total U.S. potato production from all four seasons was 459 million cwt. in 1997, a downturn of 8 percent from a year earlier but 3 percent above 1995.

Ten Western States produced 290 million cwt. in 1997, down 7 percent from last year but 5 percent above two years ago. Acreage for harvest, at 704,100 acres, was down 7 percent, while the average yield of 412 cwt. per acre was off 2 cwt. from a year ago. Lower harvested acreage from last year dropped total production in most Western States below last year's levels.

MONTANA HOG INVENTORY UP 17 PERCENT, U.S. HOG INVENTORY UP 7 PERCENT

Montana hog producers increased their inventory to 175,000 head, up 17 percent from December 1, 1996. Of the total hogs, 150,000 were market hogs , up 12 percent and 25,000 were breeding stock up 9,000 head from last year.

The number of sows farrowing from December 1996 through November 1997, at 36,000 head, were down 3 percent from the previous year. The pig crop from these farrowings also decreased, but only by 2 percent, to 315,000 pigs. The average litter rate was 8.75 compared with 8.73 last year.

There were 650 farms with pigs in Montana during 1997, down 100 farms from 1996.

U.S. inventory of all hogs and pigs on December 1, 1997, was 59.9 million head. This was 7 percent above December 1996 but 1 percent below September 1, 1997. Breeding inventory, at 6.98 million head, is up 5 percent from December 1, 1996 and up 1 percent from September 1, 1997. Market hog inventory, at 52.9 million head was 7 percent above last year but 1 percent below last quarter.

The September-November 1997 U.S. pig crop, at 25.3 million head, was 9 percent more than 1996 and 8 percent more than 1995. Sows farrowing during this period totaled 2.93 million head, 8 percent above last year. The sows farrowed during this quarter represented 42 percent of the breeding herd. The average pigs per litter continues to increase at a rapid pace, with an average of 8.63 pigs saved per litter for the September-November period. Last year the litter rate averaged 8.52 pigs per litter. Pigs saved per litter by size of operation ranged from 7.40 for operations with 1-99 hogs to 8.90 for operations with more than 5,000 hogs and pigs.

U.S. hog producers intend to have 2.91 million sows farrow during the December 1997-February 1998 quarter, 9 percent above the actual farrowings during the same period last year, and 6 percent higher than 1996. Intended farrowings for March-May 1998, at 3.04 million sows, are 3 percent above both the 1997 and the 1996 period.

The number of hog operations with hogs totaled 138,690 during 1997, down 11 percent from last year and 24 percent below 1995. Places with 2,000 or more hogs on hand accounted for 4 percent of the operations and 55 percent of the inventory. This is the second time operations with inventories over 2,000 head have controlled over 50 percent of the total inventory. The number of operations with over 5,000 head of inventory, at 1,520, accounted for 35 percent of the total inventory. The total number of hogs under contract, owned by these over 5,000 head operations, but raised by contractees, accounted for 25 percent of the total U.S. hog inventory.

NOVEMBER EGG PRODUCTION UP 2 PERCENT

U.S. egg production totaled 6.56 billion during November 1997, up 2 percent from the 6.41 billion produced in 1996. Production included 5.56 billion table eggs and 997 million hatching eggs, of which 940 million were broiler-type and 57.0 million were egg-type. The total number of layers during November 1997 averaged 309 million, up 2 percent from the average number of layers during November 1996. November egg production per 100 layers was 2,122 eggs, down slightly from November 1996. All layers in the U.S. on December 1, 1997, totaled 311 million, up 3 percent from a year ago. The 311 million layers consisted of 256 million layers producing table or commercial type eggs, 53.2 million layers producing broiler-type hatching eggs, and 2.50 million layers producing egg-type hatching eggs. Rate of lay per day on December 1, 1997, averaged 71.0 eggs per 100 layers, down fractionally from the 71.3 a year ago.

Laying flocks in the 30 major egg production States produced 6.21 billion eggs during November, up 2 percent from November 1996. The average number of layers during November, at 293 million, was up 2 percent from a year earlier.

Individual State estimates are available for the 30 major egg producing States. These States account for approximately 95 percent of the total U.S. egg production. Production for the other States are grouped into an "Other States" category and combined with the 30 States published individually to obtain a U.S. estimate. Individual State estimates' for "Other States" are available annually in the "Layers and Egg Production" report.

PLEASE RETURN

"Happy Holidays"

From all of us at Montana Agricultural Statistics Service! As 1997 comes to a close we should take a minute to look back on what has happened this year. Dry conditions during the fall of 1996 led winter wheat producers to plant the second smallest winter wheat crop since 1951.

Spring wheat acreage made up for the lost winter wheat acreage. Montana producers planted the largest spring wheat acreage since 1953. The eastern third of the state suffered from some drought-like conditions early in the year, but the rest of the state had a fair growing season with timely moisture. In 1997 farmers produced the second largest spring wheat crop on record only behind 1995's production, due mainly to the large number of acres harvested.

Montana durum wheat growers planted and harvested acres remained unchanged from last year's acreage estimates. Barley planted and harvested acreage in Montana was unchanged from 1996.

The winter of 1996-1997 was hard on livestock producers. The snow came and ranchers fed cattle all winter. Significant loses due to an extremely cold, harsh winter were felt by ranchers across Montana. El Niño has improved the prospects for the winter of 1997-1998. Things are looking up with the hope for better prices and fewer losses. Good news for cattle producers!

As we look to 1998, our role at Montana Agricultural Statistics Service is changing. Congress has charged us with the task of conducting the Census of Agriculture. Look for the Census form in your mailbox just before Christmas. Please fill it out and return it to us by February 2, 1998. If you have any questions about the Census, please call us at 1-888-4AG-STAT or 1-888-424-7828.

To everyone involved in Montana's agriculture, thanks for your continued support. With your help, we can provide sound statistical facts that you can use to chart the future course of ***Montana's Number One Industry--Agriculture****. We sincerely hope that you and your family have a joyous and safe holiday season. We expect 1998 will be a great year for Montana agriculture!*

ERS SAYS CATTLE CYCLE UNLIKELY TO TURN BEFORE 2000

According to an economist from the Economic Research Service, the cattle cycle is unlikely to turn before 2000. For the second year in a row, the January 1 Cattle report indicated that U.S. cattle producers were retaining a larger number of heifers for breeding the following summer than actually entered the herd. However, in each of the last 2 years, conditions deteriorated and a large proportion of the heifers were marketed as feeder animals rather than being retained for the breeding herd. On January 1, 1997, producers indicated they were retaining 2 percent fewer beef replacement heifers to be bred in the late-spring-early-summer breeding season. However, in the July 1 inventory report, producers indicated they were retaining 4 percent fewer heifers than a year earlier.

Although feed grain prices were well below a year earlier in the spring and summer of 1997, pasture and range conditions once again were disappointing and hay prices were at record levels, indicating very tight forage supplies. The number of heifers on feed in the 7-monthly reporting States on July 1 were up 28 percent from a year earlier. However, large placements of heavier cattle in each of the summer quarter months raised the specter of even more heifers being placed on feed. This scenario was verified by the October Cattle on Feed report indicating 21 percent more heifers on feed than a year earlier. In addition, heifer slaughter for the first 9 months of the year was at a near-record pace, second only to the major liquidation years of the mid-1970's.

The present cycle entered the liquidation phase in late 1995 and intensified in 1996 as grain stocks declined and prices set new records due to a sharp decline in the 1995/96 grain harvest. Conditions for cow-calf producers were further exacerbated by a severe drought which spread from the Southwest in late spring into the Central Plains, the heart of the cattle raising sector of the industry, by mid-summer. Drought resulted in sharply reduced grazing prospects and higher hay prices forcing cattlemen to cull herds sharply and retain fewer stocker cattle. Reduced forage supplies lowered the demand for stocker cattle to be retained for pasture gain and, at the same time, rapidly rising grain prices reduced the break-even prices cattle feeders could pay for feeder cattle to be placed on feed.

Feeder cattle weighing 750 to 800 pounds declined from a range of $67 to $74 per cwt in first-half 1995 to $55 to $59 in first-half 1996. Even as feeder cattle prices plummeted, cattle feeders sharply reduced feedlot placements in first-half 1996 to 7.567 million head, down 14 percent from a year earlier. The end result was a year of large losses for feeder cattle producers, and consequently, liquidation of the beef cow herd and sharply reduced heifer retention. Cow slaughter rose from 6.3 million head in 1995 to 7.3 million in 1996. Beef production rose to 25.4 billion pounds, second only to the 25.7 billion pounds produced in 1976 when the cattle inventory was 132 million head and the industry was in the largest liquidation in history.

Beef cow slaughter remained large during the first quarter of 1997, but has been down about 20 percent from a year earlier since spring. Although down, beef cow slaughter remains somewhat large as less efficient cows are culled due to continued tight forage supplies. Cow slaughter is expected to decline even further over the next couple of years. Without larger numbers of heifers being retained and bred, beef cow numbers will continue to decline, and thus, calf crops will decline at least through 1998.

SOURCE for the above information: Livestock, Dairy and Poultry Situation and Outlook, ERS, November 19, 1997.

AGRICULTURAL PRICES RECEIVED FOR OCTOBER

Montana winter wheat decreased 4 cents to $3.33 per bushel, but durum wheat increased 11 cents to $5.62 per bushel. Spring wheat went down 6 cents to $3.56 per bushel. Feed barley increased 7 cents per bushel to $2.10, but malt barley decreased 9 cents to $3.05 per bushel. The oats price is up 2 cents per bushel to $1.24 per bushel. The all wheat price for mid-November averaged $3.70 per bushel and the all barley price was $2.50. The price for alfalfa hay in November, at $81.00 per ton, is down $3.00 from last month. The November other hay price is down $1.00 from October at $72.00 per ton.

Livestock prices for the full month of October were mixed. Steer and heifer prices increased $4.10 to $80.50 per cwt. Cows decreased $1.40 to $33.40, but the average price for calves rose 40 cents to $87.70 per cwt. Sheep increased $1.00 to $34.10 per cwt, while lambs decreased $2.60 to $96.80 per cwt. Milk prices increased 90 cents from last month to $13.80 per cwt. Steer and heifer prices for mid-November averaged $81.70 per cwt.

Nationally, the all wheat price for October averaged $3.55 per bushel, down 35 cents from September. The all barley price averaged $2.45 per bushel, up 6 cents. Steer and heifer prices were up 30 cents to $67.30 per cwt. Cow prices were $33.10 and hog prices were $47.30 per cwt. Egg prices were 65.8 cents per dozen.

The All Farm Products Index of Prices Received in November was 107 based on 1990-92=100, unchanged from October. Price increases from October for soybeans, eggs, tomatoes, and grapes more than offset price decreases for hogs, corn, peanuts, and lettuce. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower seasonal marketings of soybeans, peanuts, potatoes, and lettuce more than offset the relatively higher marketings of cotton lint, milk, cattle, and cottonseed. These marketing changes offset the slight increase in prices.

Compared with November 1996, the All Farm Products Index was 3 points (2.7 percent) lower. Price decreases from November 1996 for hogs, broilers, corn, and milk more than offset price increases for calves, tomatoes, lettuce, and potatoes.

Ag Chemical Use

MONTANA AND U.S. RED MEAT PRODUCTION FOR OCTOBER

Montana slaughter plants produced 1.5 million pounds, dressed weight, of red meat during October 1997, down 10 percent from October 1996, but 9 percent above the previous month. Cattle slaughter totaled 1,800 head, down 200 head from a year ago. The average live weight, at 1,117 pounds, was down 27 pounds from last year.

During October, there were 1,700 hogs slaughtered, 200 head less than last year. The average live weight, at 222 pounds, was the same as a year ago. The number of sheep slaughtered, at 400 head, remained unchanged from the previous year. The average live weight increased 8 pounds from last year to 125 pounds.

U.S. commercial red meat production totaled 4.01 billion pounds, up 5 percent from the previous record high for October set in 1996. January - October red meat production was 36.1 billion pounds, down 1 percent from the comparable total a year earlier. Accumulated beef production was just below last year's figure, veal fell 11 percent, pork was down 1 percent, and lamb and mutton dropped 4 percent.

Beef production, at 2.30 billion pounds, was up 6 percent from the previous year and up 1 percent from the previous high for October set in 1975. Cattle slaughter totaled 3.23 million head, up 2 percent from a year earlier. The average live weight increased 22 pounds from the previous year to 1,195 pounds.

Veal production totaled 28.0 million pounds, down 16 percent from a year earlier. Calf slaughter totaled 140,800 head, down 15 percent from the previous year. The average live weight was down 5 pounds to 333 pounds.

Pork production, at 1.65 billion pounds, was up 4 percent from the previous year and up 1 percent from the previous record high for October set in 1994. Hog kill totaled 8.78 million head, up 2 percent from a year earlier. The average live weight was up 2 pounds from the previous year at 257 pounds.

Lamb and mutton production totaled 22.0 million pounds--dropping 7 percent from a year earlier, but equaling the record low for October set in 1995. Sheep slaughter totaled 335,400 head, 11 percent below the previous year. The average live weight was up 7 pounds to 132 pounds.

U.S. CATTLE ON FEED UP 9 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.99 million head on November 1, 1997. The inventory was 9 percent above November 1, 1996.

Placements in feedlots during October totaled 2.90 million, 4 percent below 1996. Net placements were 2.81 million. During October, placements of cattle and calves weighing less than 600 pounds were 816,000, 600-699 pounds were 715,000, 700-799 pounds were 745,000, and 800 pounds and greater were 620,000. Marketings of fed cattle during October totaled 1.78 million, 5 percent above 1996. Other disappearance totaled 91,000 during October, 17 percent above the previous year.

Cattle on Feed in Historic 7 States Up 10 Percent

Cattle on feed November 1, 1997, in the historic 7 States for feedlots with capacity of 1,000 or more head totaled 9.39 million, up 10 percent from the previous year and 12 percent above November 1, 1995. Placements in feedlots during October totaled 2.43 million, 4 percent below 1996 but 7 percent above 1995. Marketings during October totaled 1.53 million, 7 percent above 1996 but slightly below 1995. Other disappearance during October was 77,000 head, 35 percent above 1996 and 51 percent above 1995.

AGRICULTURAL CHEMICAL USE

A portion of the 1996 Ag Chemical Usage report issued by the National Agricultural Statistics Service (NASS) is included in this Reporter. The full report and/or additional information can be obtained by calling our office at 1-800-835-2612. The data presented in the report are part of the data series on chemical use funded through the 1990 Water Quality Assurance Initiative.

Wheat Highlights

Nitrogen fertilizer was applied to 86 percent of the harvested area in the ten surveyed states; growers in all ten treated at least 75 percent of the grain area. Phosphate fertilizers were applied to 51 percent of the collective acreage in the ten states, ranging from just 10 percent in Oregon to Montana's 80 percent. All surveyed States treated at least a portion of the acreage with herbicides; 2,4-D was again the most prevalent in terms of area and total application.

Most of the planted acres of North Dakota's Durum and the collective 3-state other spring plantings had primary fertilizer percent coverages similar to that of 1995. Minnesota had the highest percent coverage for all three primary nutrients. The three most popular herbicides in terms of all spring wheat area covered were 2,4-D, MCPA and Dicamba in that order. However, Durum growers applied Dicamba to a larger area than they did MCPA.
See table on back page.

U.S. ALL SHEEP & LAMBS INVENTORY TOTALS 7.86 MILLION HEAD ON NOVEMBER 1, 1997

All sheep and lambs in the United States on November 1, 1997 totaled 7.86 million head, 7 percent below November 1, 1996. The number of breeding sheep and lambs on hand November 1, 1997 reached 5.42 million head, 8 percent below November 1, 1996. Market sheep and lambs (including newborns), at 2.45 million head, were 4 percent below November 1, 1996.

Of the November 1 breeding herd 4.47 million head were ewes one year old and older, 195,000 head were rams one year old and older, and 750,000 head were replacement lambs (including newborn lambs).

Of the total market lambs (including newborn lambs), 16.9 percent were under 65 pounds, 28.7 percent were 65 to 84 pounds, 31.4 percent were 85 to 105 pounds and 23.0 percent were over 105 pounds on November 1.

The November 1 sheep and lamb numbers are published by regions. Montana is included with Colorado, South Dakota, Utah and Wyoming. The total number of sheep and lambs in the region was 2.5 million head, down 10 percent from a year ago. This region accounted for 31.6 percent of the total sheep and lambs.

SHEEP AND LAMBS INVENTORY: By Region and United States, November 1, 1997

Regions 1/	All Sheep and Lambs	Market Sheep and Lambs	Breeding Sheep One Year Old and Older		Replacement Lambs	Total Breeding Sheep & Lambs

OCTOBER MILK PRODUCTION UP 1.8 PERCENT

Milk production in the 20 major States during October totaled 11.0 billion pounds, up 1.8 percent from production in these same States in October 1996. September revised production, at 10.7 billion pounds was up 2.2 percent from September 1996.

Production per cow in the 20 major States averaged 1,426 pounds for October, 35 pounds above October 1996.

The number of cows on farms in the 20 major States was 7.74 million head, 51,000 head less than October 1996 but 1,000 head more than September 1997.

MONTANA WAGE RATES UP 3 PERCENT, U.S. UP 5 PERCENT ABOVE A YEAR AGO

The average wage received by all hired agricultural workers in Montana during 1997 was $6.15 per hour compared with the $5.99 per hour received in 1996. Field workers increased their wages by $.51 per hour from last year to earn $6.21 per hour. Field and livestock workers combined wages increased $.24 per hour from a year ago to $5.91 per hour.

There were 1.29 million hired workers on the Nation's farms and ranches during the week of October 12-18, 1997, up 5 percent from a year ago. Farm operators directly hired 1,003,000 workers. Agricultural service employees on farms and ranches made up the remaining 283,000 workers. Migrant workers accounted for 11.2 percent of the hired workforce.

Farm operators paid their hired workers an average wage of $7.31 per hour during the October 1997 survey week, up 34 cents from a year earlier. Field workers received an average of $6.94 per hour, up 36 cents. Livestock workers earned $6.80 per hour compared with $6.57 a year earlier.

Crew leaders and custom crews provided 283,000 workers for the Nation's farms and ranches during the week of October 12-18, 1997. Service workers in California numbered 85,000 compared with 88,000 during the October 1996 survey week. Florida's number of service workers was 5,700 compared with 7,000 last year.

HIRED WORKERS: Annual Average Wage Rates By Selected States and United States, 1996-97 1/ 2/

	All Hired		Field		Field & Livestock

US 3/	6.78	7.36	6.34	6.66	6.33	6.64

1/ Excludes Agricultural Service Workers. 2/ Annual rates are averages of the published wage rates for each survey week weighted by the number of hours worked during the week. The annual average for all States, Regions, and the U.S. is based on data collected for January. 3/ Excludes AK.

OCTOBER U.S. EGG PRODUCTION UP 2 PERCENT

U.S. egg production totaled 6.65 billion during October 1997, up 2 percent from the 6.50 billion produced in 1996. Production included 5.61 billion table eggs and 1.03 billion hatching eggs, of which 975 million were broiler-type and 59.0 million were egg-type. The total number of layers during October 1997 averaged 306 million, up 2 percent from the average number of layers during October 1996. October egg production per 100 layers was 2,171 eggs, the same as in October 1996.

All layers in the U.S. on November 1, 1997, totaled 306 million, up 2 percent from a year ago. The 306 million layers consisted of 251 million layers producing table or commercial type eggs, 52.6 million layers producing broiler-type hatching eggs, and 2.46 million layers producing egg-type hatching eggs. Rate of lay per day on November 1, 1997, averaged 70.4 eggs per 100 layers, up fractionally from the 70.2 a year ago.

Laying flocks in the 30 major egg production States produced 6.30 billion eggs during October, up 2 percent from October 1996. The average number of layers during October, at 290 million, was up 2 percent from a year earlier.

Individual State estimates are available for the 30 major egg producing States. These States account for approximately 95 percent of the total U.S. egg production. Production for the other States are grouped into an "Other States" category and combined with the 30 States published individually to obtain a U.S. estimate. Individual State estimates' for "Other States" are available annually in the "Layers and Egg Production" report.

Red Meat Production

OCTOBER 1, 1997 SUGAR BEET AND HAY PRODUCTION

Montana sugar beet production is forecast at 1.31 million tons, up slightly from last year and up 6 percent from last month's forecast. Forecasted yield was raised 1.2 tons per acre from last month to 2.4 tons per acre which is down 0.2 ton per acre from last year. Harvested acreage remains unchanged at 58,500 acres, up 1,000 acres from last year. As of October 5th, 17 percent of the crop had been harvested equal to the five-year average.

Sugar beet production for the U.S. is expected to total 29.6 million tons, an increase of 11 percent from 1996 and up 1 percent from September. Area for harvest, at 1.43 million acres, is up 8 percent from last year, but equal to the September forecast. The average yield, at 20.7 tons per acre, is 0.5 tons above 1996 and 0.2 tons above the yield forecasted in September.

Forecasted hay yields for Montana were increased from the August forecast. Alfalfa hay yields rose 0.1 ton per acre to 2.6, which is 0.5 tons higher than 1996. Total production of alfalfa hay is estimated at 4.55 million tons up 27 percent from last year due to both increased acreage harvested and higher yields. If realized this would be a record production of alfalfa. Harvested acreage is estimated at 1.75 million acres, up 50,000 from last year and is the largest acreage on record. Other hay yields also rose 0.1 tons to 1.7 tons per acre, up 0.2 tons from 1996. Total production is set at 1.445 million tons, up 7 percent from last year. Acreage harvested is unchanged at 850,000 acres, down 50,000 acres from last year. All hay production is estimated to be a record 5.995 million tons, up 22 percent from last year and up 12 percent from the previous record set in 1995.

U.S. all hay production for 1997 is forecast at 152 million tons, down 1 percent from the August forecast, but up 2 percent from 1996. Area harvested and to be harvested for alfalfa and alfalfa mixtures and other hay was unchanged from August at 60.8 million acres, down slightly from the previous year. All hay yields are forecast at 2.50 tons per acre, down slightly from August, but up 0.05 tons from the previous year. Expected production declines from August in Texas, Nebraska, Wisconsin, Minnesota, and Kentucky more than offset expected increases in California, South Dakota, Kansas, and Montana. Below normal precipitation and above normal temperatures during the late summer months were the main reasons given for the drop in expected yields from the previous forecast.

U.S. production of alfalfa and alfalfa mixtures is forecast at 78.2 million tons, up slightly from the August forecast, but down 2 percent from a year ago. Yields are expected to average 3.32 tons per acre, up 0.02 tons from the previous forecast and 0.05 tons above last year. Area harvested and to be harvested was unchanged from August at 23.6 million acres, down 3 percent from 1996. Yield increases from August were common across the western half of the country, while decreases were common in the Lake States (Minnesota, Wisconsin, Michigan) and the Northeast (New York, Pennsylvania).

U.S. all other hay production is 74.0 million tons, 3 percent below the August forecast, but 6 percent above the year earlier. Despite the reduction in expected yields from August, the current forecast still represents a record other hay production. Other hay yields are expected to average 1.99 tons per acre, down 0.05 tons from August, but up 0.08 ton from 1996. Area harvested and to be harvested was unchanged from August at 37.3 million acres, up 1 percent from last year.

U.S. SEPTEMBER EGG PRODUCTION

U.S. egg production totaled 6.33 billion during September 1997, up 2 percent from the 6.24 billion produced in 1996. Production included 5.34 billion table eggs and 990 million hatching eggs, of which 934 million were broiler-type and 56.0 million were egg-type. The total number of layers during September 1997 averaged 302 million, up 1 percent from the average number of layers during September 1996. September egg production per 100 layers was 2,097 eggs, compared with 2,094 in September 1996.

All layers in the U.S. on October 1, 1997, totaled 305 million, up 2 percent from a year ago. The 305 million layers consisted of 250 million layers producing table or commercial type eggs, 52.0 million layers producing broiler-type hatching eggs, and 2.57 million layers producing egg-type hatching eggs. Rate of lay per day on October 1, 1997, averaged 69.8 eggs per 100 layers, up fractionally from the 69.7 a year ago.

Laying flocks in the 30 major egg production States produced 6.00 billion eggs during September, up 2 percent from September 1996. The average number of layers during September, at 286 million, was up 2 percent from a year earlier.

[1/] Preliminary. [2/] Planted for all purposes. [3/]Production forecast available November 10, 1997.

U.S. CATTLE ON FEED UP 13 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.96 million head on October 1, 1997. The inventory was 13 percent above October 1, 1996. The inventory included 6.04 million steers and steer calves, up 9 percent from the previous year. This group accounts for 61 percent of the total inventory. Heifers and heifer calves accounted for 3.89 million head, up 20 percent from 1996.

Placements in feedlots during September totaled 2.71 million, 2 percent above 1996. Net placements were 2.66 million. During September, placements of cattle and calves weighing less than 600 pounds were 480,000, 600-699 pounds were 498,000, 700-799 pounds were 817,000, and 800 pounds and greater were 916,000.

Marketings of fed cattle during September totaled 1.82 million, 15 percent above 1996. Other disappearance totaled 53,000 during September, 24 percent below the previous year.

MONTANA JULY-SEPTEMBER MILK PRODUCTION DOWN

Montana milk cows produced 76 million pounds of milk during the period of July-September 1997, compared with 78 million the same quarter a year ago. Montana milk cow inventory declined from 20,000 head a year ago to 19,000 head this year.

The daily amount of grain and other concentrates fed to Montana's milk cows on September 1, averaged 16.0 pounds per cow, down 0.5 pounds from last year. The value of the grains and other concentrates fed, at $7.70 decreased 70 cents from a year ago.

During the July-September period, the U.S. produced 39.0 billion pounds of milk, 3.5 percent above the July-September period last year. The average number of milk cows in the U.S. during the July-September quarter was 9.25 million head, 91,000 head less than the same period last year.

Grain and other concentrates fed to milk cows on October 1, 1997 averaged 18.7 pounds, up 0.7 pounds from October 1, 1996, but down 0.3 pounds from Jul 1, 1997. The value of grain and other concentrates fed to milk cows on October 1, 1997 averaged $8.51 per cwt., $1.02 less than October 1, 1996.

MONTANA RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 1.4 million pounds, dressed weight, of red meat during September 1997, down 5 percent from September 1996, and down 12 percent from the previous month. Cattle slaughter totaled 1,600 head, unchanged from a year ago. The average liveweight, at 1,121 pounds, was down 44 pounds from last year.

During September, there were 2,100 hogs slaughtered, 100 head less than last year. The average liveweight, at 218 pounds, was down 6 pounds from a year ago. The number of sheep slaughtered, at 400 head, was 100 head more than the previous year. The average liveweight increased 12 pounds from last year to 127 pounds.

U.S. commercial red meat production totaled 3.67 billion pounds during September, up 8 percent from the previous year. January - September red meat production was 32.1 billion pounds, down 1 percent from the comparable figure a year earlier. Accumulated beef production was down 1 percent, veal was down 10 percent, pork was down 1 percent, and lamb and mutton was down 3 percent.

Beef production, at 2.13 billion pounds, was up 10 percent from the previous year. Cattle slaughter totaled 2.97 million head, up 8 percent from a year earlier. The average live weight was up 14 pounds from the previous year, at 1,193 pounds.

Veal production totaled 28.0 million pounds, down 11 percent from a year earlier. Calf slaughter totaled 136,400 head, down 9 percent from the previous year. The average live weight was down 3 pounds to 334 pounds.

Pork production, at 1.49 billion pounds, was up 6 percent from the previous year. Hog kill totaled 8.02 million head, up 4 percent from a year earlier. The average live weight was up 4 pounds from the previous year at 254 pounds.

Lamb and mutton production totaled 21.0 million pounds, up 4 percent from a year earlier. Sheep slaughter totaled 322,800 head, 1 percent below the previous year. The average live weight was up 7 pounds to 129 pounds.

1997 Small Grain Summary
Quarterly Grain Stocks
Ag Prices Received

SEPTEMBER 1997 SMALL GRAIN SUMMARY

Dry conditions during the fall of 1996 led winter wheat producers to plant the second smallest winter wheat crop since 1951. Montana's winter wheat acreage was estimated at 1.6 million acres, down 26% from last year. Winter kill caused many acres to be reseeded, but producers were able to harvest 1.45 million acres, down 27% from 1996. Adequate moisture at the beginning of the season and timely rains in most of the winter wheat producing areas set the stage for the fourth highest yield on record. Average yield was estimated at 39 bushels per acre, up 7 bushels from last year, for a total production of 56.55 million bushels which is down 11% from 1996.

Spring wheat acreage made up for the lost winter wheat acreage. Montana producers planted an estimated 4.35 million acres, up 150,000 from last year, and the largest spring wheat acreage planted since 1953 when other spring and durum wheat records were combined. The eastern third of the state suffered from some drought-like conditions early in the year, but the rest of the state had a fair growing season with timely moisture. Producers were able to harvest 4.2 million acres, up 100,000 from last year. Yields averaged 29 bushels per acre across the state, up 3 bushels from 1996, but down nearly 3 bushels from the five-year average due mainly to lower yields in the eastern third of the state. Total production was estimated at 121.8 million bushels, up 14% from last year. This is the second largest crop on record only behind 1995's production, due mainly to the large number of acres harvested.

Montana durum wheat growers planted 290,000 acres and harvested 280,000 acres, both unchanged from last year's revised acreage estimates. Droughty conditions held back average yield and was estimated at 26 bushels per acre, up 1 bushel from last year, when drought-like conditions also occurred. Total production was estimated at 7.28 million bushels, up nearly 4 percent from last year.

Barley acreage in Montana was estimated at 1.3 million acres with harvested acreage set at 1.2 million acres, both unchanged from 1996. Average yields were set at 53 bushels per acre, up 10 bushels from last year. This is the second highest yield on record. Not as much barley is grown in the eastern portion of the state which kept yields up unlike spring wheat. Total production was estimated at 63.6 million bushels, up 23 percent from last year.

Oat production was estimated at 3.85 million bushels, up nearly twice the amount produced last year. Producers harvested more acreage and had better yields than 1996. Planted acreage was estimated at 140,000 acres, up 40,000 from last year. Harvested acreage was set at 70,000 acres, up 20,000 from last year. Yields averaged 55 bushels per acre, up 15 bushels from last year.

At the National level, the 1997 winter wheat production was estimated at 1.88 billion bushels, up 1 percent from the August forecast and 27 percent more than 1996. This is the largest production level since 1990. Yields averaged a record high 45.0 bushels per acre. This is up 0.4 bushels from the last forecast and nearly eight bushels per acre better than the 1996 average. Harvested area was estimated at 41.8 million acres, up 1 and 5 percent from August and last year, respectively, and was largely due to an increase in the Kansas harvested area.

U.S. other spring wheat production in 1997 was estimated at 558 million bushels, down 1 percent from the September forecast and 19 percent less than in 1996. Harvested area was 18.7 million acres, down 5 percent from last year. Decreased North Dakota acreage more than offset the increased Minnesota grain area. The U.S. yield was 29.9 bushels per acre, down a tenth of a bushel from September, and 5.2 bushels per acre below last season's average. This is the lowest U.S. yield since 1989.

Durum production, at the National level, for 1997 was estimated to total 86.2 million bushels, down 4 percent from the last forecast and 26 percent less than in 1996. The U.S. yield was placed at 27.7 bushels per acre, down 0.4 bushels from the last forecast to the lowest average in eight years. Area for grain now totals 3.11 million acres, down 3 and 13 percent from the last forecast and 1996, respectively.

U.S. barley production in 1997 was estimated at 374 million bushels, down 5 percent from last year's estimate. Average yield per acre, at 58.3 bushels, was down 0.2 bushels from 1996. The area harvested for grain was estimated at 6.43 million acres, 5 percent less than a year ago. Production was 1 percent below the September 1 forecast.

U.S. production of oats in 1997 totaled 176 million bushels, 13 percent above last year's record low crop. Despite the increased production over 1996, the 1997 crop is still the third lowest production on record since 1866. Grain yield per harvested acre averaged 60.5 bushels, up 2.7 bushels from 1996 and the third highest yield on record. Area harvested for grain, at 2.91 million acres, was up 8 percent from last year, and is the second lowest harvested acreage since estimates were first made.

The Montana crop acreage and grain stocks estimates in this issue of the Reporter are the result of surveying approximately 3,000 Montana farmers and ranchers during September. Names were selected on a statistical probability basis. SPECIAL THANKS to those operators that were interviewed and responded to the survey. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics.

SEPTEMBER 1, 1997 GRAIN STOCKS

All wheat stocks in Montana on September 1, 1997 totaled 190.2 million bushels, up 12% from the same quarter last year. Stocks stored on the farm accounted for 161.0 million bushels of the total with the remaining 29.2 million stored off farm. All spring wheat stocks, at 135.6 million bushels, was up 15% from last year and accounted for 71% of the total wheat stocks. Winter wheat stocks were estimated at 54.6 million, up 4% from last year. Durum wheat stocks were estimated at 6.6 million bushels, up 10% from last year. Barley stocks in all positions on September 1, 1997 were up 11% from last year and were set at 54.5 million bushels. Oat stocks on September 1, 1997 were up 56% from a year ago and were estimated at 3.98 million bushels.

Nationally, all wheat stocks in all storage positions September 1, 1997 were estimated at 2.07 billion bushels, up 20 percent from September 1, 1996. Farm stocks totaled 794 million bushels, and off-farm stocks were 1.28 billion bushels. The on-farm total was down 4 percent from a year ago, but the off-farm level was up 42 percent. All wheat disappearance for the first quarter of the 1997-98 marketing year totals 897 million bushels, down 4 percent from the same period a year ago.

U.S. durum wheat stored in all positions on September 1, 1997 totaled 87.8 million bushels, down 14 percent from last September. On farm stocks, at 51.0 million bushels, were down 36 percent from last year. Disappearance from all positions was 29.1 million bushels, down 26 percent from June-August 1996.

Barley stocks, at the national level, in all positions on September 1, 1997 were estimated at 326 million bushels, 3 percent above the stocks of September 1, 1996. Indicated disappearance during the June-August quarter totaled 158 million bushels, 12 percent below the same period a year earlier. Oats stored nationally in all positions on September 1, 1997 totaled 155 million bushels, 16 percent above the stocks on September 1, 1996. Indicated disappearance during the June-August quarter totaled 88 million bushels, fractionally below the same period a year ago. Old crop corn, at the U.S. level, stored in all positions on September 1, 1997, was estimated at 884 million bushels, up 108 percent from September 1, 1996, but still 43 percent below the September 1, 1995 level.

AGRICULTURAL PRICES RECEIVED FOR AUGUST

Montana wheat prices, with the exception of durum, fell slightly from July. Winter wheat fell 4 cents to $3.72 per bushel, spring wheat fell 5 cents to $3.84 per bushel, but durum rose 55 cents to $4.97 per bushel. The all wheat average price was $3.90 for August, down 2 cents from July. Barley prices also showed a decrease from a month ago with feed barley averaging $2.06 per bushel, down 10 cents, and malt barley fell one cent to $3.28 per bushel. Oats averaged $1.32 per bushel. August alfalfa hay prices were up $3.00 from July to $82.00 per ton and other hay prices went up $2.00 to $73.00 per ton.

Livestock prices for the full month of August were higher except for cows and sheep. Steer and heifer prices, at $77.30 per cwt, were up $4.10. Cow prices fell $1.20 to $39.20 per cwt and the average price of calves rose $6.00 to $85.80 per cwt. Steer and heifer prices for mid-September averaged $77.00 per cwt. August sheep prices, at $40.50, were down $3.40 per cwt, while lamb prices rose $9.50 per cwt to $98.80. August milk prices increased 20 cents to $12.30 per cwt.

Nationally, the all wheat price for August averaged $3.56 per bushel, up 33 cents from July. The all barley price averaged $2.37 per bushel, up 10 cents. Steer and heifer prices were up $1.20 to $66.60 per cwt. Cow prices were $36.40 and hog prices were $55.30 per cwt. Egg prices were 63.5 cents per dozen.

The All Farm Products Index of Prices Received in September was 108 based on 1990-92=100, unchanged from August. Price increases from August for tobacco, milk, eggs, and grapes offset price decreases for hogs, broilers, soybeans, and onions. The seasonal changes in the mix of commodities farmers sell also affect the overall index level, however, these changes were essentially offsetting in September.

Compared with September 1996, the All Farm Products Index was 8 points (6.9 percent) lower. Price decreases from September 1996 for corn, milk, wheat, and soybeans more than offset price increases for lettuce, calves, potatoes, and hay.

MONTANA AND US RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 1.6 million pounds, dressed weight, of red meat during August, down 13 percent from last year. However, red meat production was up 17 percent from last month. There were 1,800 head of cattle slaughtered during August, 200 head fewer than August 1996. The average live weight of cattle slaughtered dropped 38 pounds from a year ago to 1,116 pounds.

The number of hogs slaughtered dropped 400 head from last year to 2,000 head. The average live weight, at 220 pounds, was the same as a year earlier. There were 400 sheep slaughtered during August, down 100 head from the previous year. The average live weight of sheep slaughtered was up 1 pound to 118 pounds.

Commercial red meat production for the United States totaled 3.62 billion pounds during August, down 2 percent from the previous year. Beef production, at 2.22 billion pounds, was down 2 percent from the previous year. Cattle slaughter totaled 3.11 million head, down 3 percent from a year earlier. The average live weight was up 12 pounds from the previous year, at 1,187 pounds.

Veal production totaled 25.0 million pounds, down 20 percent from a year earlier. Calf slaughter totaled 125,500 head, down 20 percent from the previous year. The average live weight was down 2 pounds to 334 pounds.

Pork production, at 1.35 billion pounds, was down 3 percent from the previous year. Hog kill totaled 7.35 million head, down 4 percent from a year earlier. The average live weight was up 1 pound from the previous year at 251 pounds.

Lamb and mutton production totaled 19.0 million pounds, down 5 percent from the previous record low for August set in 1996. Sheep slaughter totaled 301,900 head, 9 percent below the previous year. The average live weight was up 5 pounds to 127 pounds.

January - August red meat production was 28.4 billion pounds, down 2 percent from the comparable figure a year earlier. Accumulated beef production was down 2 percent, veal was down 10 percent, pork was down 2 percent, and lamb and mutton was down 4 percent.

U.S. CATTLE ON FEED UP 16 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.12 million head on September 1, 1997. The inventory was 16 percent above September 1, 1996.

Placements in feedlots during August totaled 2.43 million, 7 percent above 1996. Net placements were 2.38 million. During August, placements of cattle and calves weighing less than 600 pounds were 461,000, 600-699 pounds were 474,000, 700-799 pounds were 725,000, and 800 pounds and greater were 769,000.

Marketings of fed cattle during August totaled 2.03 million, 5 percent above 1996. Other disappearance totaled 45,000 during August, 10 percent below the previous year.

Cattle on Feed in Historic 7 States Up 19 Percent

Cattle on feed September 1, 1997, in the historic 7 States for feedlots with capacity of 1,000 or more head totaled 7.85 million, up 19 percent from the previous year and up 9 percent from September 1, 1995.

Placements in feedlots during August totaled 2.11 million, 7 percent above 1996 and 28 percent above 1995. Marketings during August totaled 1.76 million, 6 percent above 1996 but 3 percent below 1995.

Other disappearance during August was 42,000 head, 14 percent above 1996 and 5 percent above 1995.

U.S. AUGUST MILK PRODUCTION UP 4.4 PERCENT

Milk production in the 20 major States during August totaled 11.3 billion pounds, up 4.4 percent from production in these same States in August 1996. July revised production, at 11.4 billion pounds was up 4.6 percent from July 1996.

Production per cow in the 20 major States averaged 1,454 pounds for August, 72 pounds above August 1996. The number of cows on farms in the 20 major States was 7.74 million head, 58,000 head less than August 1996 and 3,000 head less than July 1997.

EGG PRODUCTION

U.S. egg production totaled 6.47 billion during August 1997, up fractionally from the 6.45 billion produced in 1996. Production included 5.45 billion table eggs and 1.02 billion hatching eggs, of which 962 million were broiler-type and 56.0 million were egg-type. The total number of layers during August 1997 averaged 299 million, up 1 percent from the average number of layers during August 1996. August egg production per 100 layers was 2,164 eggs, compared with 2,172 in August 1996.

All layers in the U.S. on September 1, 1997, totaled 300 million, up 1 percent from a year ago. The 300 million layers consisted of 245 million layers producing table or commercial type eggs, 52.0 million layers producing broiler-type hatching eggs, and 2.43 million layers producing egg-type hatching eggs. Rate of lay per day on September 1, 1997, averaged 70.0 eggs per 100 layers, up fractionally from the 69.9 a year ago.

Laying flocks in the 30 major egg production States produced 6.14 billion eggs during August, up 1 percent from August 1996. The average number of layers during August, at 283 million, was up 1 percent from a year earlier.

HOGS AND PIGS

U.S. inventory of all hogs and pigs on September 1, 1997, was 60.3 million head. This was 4 percent above both the September 1996 and June 1, 1997, inventories. Breeding inventory, at 6.95 million head is up 3 percent from September 1, 1996 and virtually unchanged from June 1, 1997. Market hog inventory, at 53.3 million head was 4 percent above last year and last quarter.

The June-August 1997 U.S. pig crop at 25.2 million head was 7 percent more than 1996 and 2 percent more than 1995. Sows farrowing during this period totaled 2.90 million head, 5 percent above last year. The sows farrowed during this quarter represented 42 percent of the breeding herd. The average pigs per litter continues to increases at a rapid pace, with an average of 8.70 pigs saved per litter for the June-August period. Last year the litter rate averaged 8.57 pigs per litter. Pigs saved per litter by size of operation ranged from 7.50 for operations with 1-99 hogs to 8.90 for operations with more than 2,000 hogs and pigs.

U.S. hog producers intend to have 2.89 million sows farrow during the September-November 1997 quarter, 7 percent above the actual farrowings during the same period last year, and 3 percent higher than 1995. The intentions for September-November represent 42 percent of the September 1 breeding herd. Intended farrowings for December 1997-February 1998, at 2.88 million sows are 8 percent above 1997 and 5 percent above the 1996 period. This represents 41 percent of the breeding herd.

1996 POTATO PRODUCTION AND DISPOSITION

Montana's 1996 potato production totaled 3.21 million cwt., 9 percent above last year and just slightly higher than 1994. Producers harvested 10,200 acres, 400 acres more than a year ago and 200 acres more than two years ago. Potato yields averaged 315 cwt. per acre compared with 300 cwt. in 1995.

Value of production from the 1996 crop was $21.2 million, down 23 percent from 1995. The average price was $6.60 per cwt. down $2.75 from the previous year's crop. Sales of Montana's 1996 potato crop totaled $18.8 million which is a 24 percent decrease from last year's crop. Producers sold 2.8 million cwt. from the 1996 crop compared with 2.7 million cwt. a year ago.

Total U.S. 1996 potato production is estimated at a record large 499 million cwt, up 12 percent from 1995 and 7 percent above the previous record in 1994. Harvested area, at 1.43 million acres, gained 4 percent from 1995 was 3 percent above 1994. The average yield of 350 cwt per acre was also record high, 27 cwt above 1995 and 11 cwt above 1994. In 1996, all seasonal groups increased in production from the previous year: Winter jumped 32 percent; spring increased 11 percent; summer rose 9 percent; and fall potatoes gained 13 percent.

Summer potato production was revised to 19.5 million cwt in 1996, up 9 percent from 1995 and 12 percent above comparable totals in 1994. Harvested area of 74,800 acres increased 6 percent from 1995, while the average yield of 261 cwt per acre gained 7 cwt from a year earlier. The revised production estimate places the summer potato crop 3 percent above the July 1996 forecast.

Fall potatoes were finalized at a record large 453 million cwt, 13 percent above 1995 and 7 percent above 1994. Area harvested in 1996 was estimated at 1.25 million acres, up 3 percent from the last two years. The average yield, at 364 cwt per acre, gained 30 cwt from 1995. The final production of fall potatoes is 1 percent above the first forecast made in November 1996. Planting started late, but good weather in June led to high production in many States. Record large potato crops were produced in Idaho, Washington, Wisconsin, Oregon, and Colorado.

Value of all potato production was estimated at $2.43 billion, a 19 percent drop from the record high value in 1995 and the lowest value since 1992. The average price dropped to $4.93 per cwt compared with $6.77 in 1995 and $5.58 in 1994. This was the lowest average price since 1987.

Sales from the 1996 potato crop totaled a record large 451 million cwt, up 10 percent from 1995 and 6 percent above 1994. Non sales accounted for 47.5 million cwt of 1996 potatoes, 35 percent above the previous year and 10 percent above 1994. Over the past 5 years, an average of 91 percent of the potatoes produced have been sold. The other 9 percent was either lost (shrinkage and loss) or used for seed, home use, and livestock feed on farms where grown. In the 1996 season, farmers sold 90.5 percent of their crop and kept or lost 9.5 percent.

Processors used a record large 283 million cwt of raw potatoes from the 1996 crop, up 11 percent from 1995 and 8 percent above 1994. Table stock sales totaled 131 million cwt, up 6 percent from last year. Seed sales of 24.3 million cwt were down 6 percent. Sales for livestock feed, at 12.1 million cwt, almost quadrupled from 1995 and included about 7 million cwt diverted under a Government program.

Chip potato use totaled 48.0 million cwt, up 1 percent from a year earlier. Freezers took a record 174 million cwt of raw potatoes, a gain of 12 percent, while dehydrating claimed a record high 54.3 million cwt, up 20 percent. Canning use totaled 5.04 million cwt, off 12 percent. Starch, flour and other products were made from 1.96 million cwt of potatoes, up 17 percent.

Shrinkage and loss was estimated at 41.2 million cwt, the highest since 1985 and 40 percent above 1995. Livestock feed and home use totaled 1.54 million cwt, up 60 percent. Growers kept 4.69 million cwt for seed on their own farms, down 2 percent from the previous year.

HIGHLIGHTS:

September 1 Crop Production
Montana Wheat & Barley Movement
Ag Prices Received

SEPTEMBER 1, 1997 CROP PRODUCTION FORECAST

Montana's other spring wheat production forecast was raised from last month. As of September 1, production is forecast at 121.8 million bushels. If realized, this would be 14 percent more than last year and the second largest other spring wheat crop on record. The large crop is due mainly to the increased planted acreage. Average yield was increased one bushel from last month to 29 bushels per acre which is 3 bushels higher than 1996. Harvested acreage remains unchanged at 4.2 million acres. So far the weather has cooperated and by September 7th, 75 percent of the crop had been harvested. There have been few problems reported, except for wheat stem sawfly.

Durum wheat production remains unchanged from a month ago at 7.75 million bushels, up 15% from last year. Yields are expected to average 25 bushels per acre--the same as last year. Harvested acreage is estimated at 310,000 acres.

Winter wheat production is not forecast as of September 1. However, if you add this month's spring and durum wheat production to the August winter wheat production, it gives an all wheat production total of 185.05 million bushels. That's up nearly 5 percent from last year and the third largest wheat crop on record.

Barley production also remains unchanged from a month ago and is forecast at 64.8 million bushels, up nearly 26 percent from 1996. Yields are expected to average 54 bushels per acre compared with 43 bushels last year. If realized this would be the second highest yield on record. Harvested acreage remains at 1.2 million acres.

Forecasted **sugar beet** yields remain unchanged from a month ago at 21.2 tons per acre, down 1.4 tons from last year. Total production is forecast at 1.24 million tons, down 5 percent from last year.

New **hay** production estimates will be available October 10. The August 1 all hay production estimate was set at 5.735 million tons, up 17 percent from 1996.

At the U.S. level, all wheat production is placed at 2.51 billion bushels, down 1 percent from the last forecast, but 10 percent more than in 1996. The U.S. yield is now forecast at 39.5 bushels per acre. This is 0.4 bushels less than last month, but equals the record high yield. Other spring wheat production is now forecast at 562 million bushels, down 4 percent from last month. The U.S. yield is forecast at 30.0 bushels per acre. This is 1.3 bushels per acre lower than August 1. There were no acreage changes. Hard Red Spring production is down from last month as declines in Minnesota and the Dakotas more than offset improved Montana prospects. White Spring production is up again because of the improved Washington crop. Durum wheat production is forecast at 90.2 million bushels, unchanged from last month, but still well below last year. Yields are expected to average 28.1 bushels per acre, down 4.6 bushels from last year.

U.S. barley production is forecast at 379 million bushels, down slightly from August and 4 percent below the 1996 production. The expected yield per acre is forecasted at 59.3 bushels, down 0.1 bushels from last month, but 0.8 bushels above 1996. Area harvested and to be harvested was unchanged from August at 6.40 million acres, down 6 percent from the previous year.

Sugar beet production for the U.S. is expected to total 29.4 million tons, an increase of 10 percent from 1996, but down 1 percent from the August "Crop Report". Area for harvest, at 1.43 million acres, is up 8 percent from last year, but down slightly from the August forecast. The average yield, at 20.5 tons per acre, is 0.3 tons above 1996, but 0.1 tons below the yield forecasted in August.

Corn production is forecast at 9.27 billion bushels, virtually unchanged from last month and 1996. Based on conditions as of September 1, yields are expected to average 125.2 bushels per acre, down 0.1 bushels from last month and 1.9 bushels from 1996. Acreage harvested and to be harvested for grain is forecast at 74.0 million acres, unchanged from last month. Yield prospects in Indiana and Wisconsin decreased. Forecasted yields in Illinois, Iowa, Minnesota, Nebraska, and Ohio were unchanged.

AGRICULTURAL PRICES RECEIVED FOR JULY

Montana winter wheat decreased 28 cents to $3.76 per bushel, but durum wheat increased 22 cents to $4.42 per bushel. Spring wheat went down 10 cents to $3.89 per bushel. Feed barley decreased 11 cents per bushel to $2.16 and malt barley increased 32 cents to $3.29 per bushel. The oats price was not published this month because of insufficient movement. The all wheat price for mid-August averaged $4.00 per bushel and the all barley price was $2.25. The price for alfalfa hay in August, at $82.00 per ton, is up $3.00 from last month. The August other hay price increased $2.00 since July to $73.00 per ton.

Livestock prices for the full month of July were higher except for lambs. Steers and heifers prices increased 80 cents to $73.20 per cwt. Cows increased 80 cents to $40.40 and the average price for calves rose 50 cents to $79.80 per cwt. Sheep increased $6.70 to $43.90 per cwt, but lambs decreased $3.60 to $89.30 per cwt. Milk prices were unchanged from last month at $12.10 per cwt. Steer and heifer prices for mid-August averaged $76.60 per cwt.

Nationally, steer and heifer prices averaged $65.40 per cwt for the full month of July. Cow prices came in at $38.20 and hogs were $58.90 per cwt. The U.S. all wheat price was $3.23 per bushel and $2.27 per bushel for all barley. Egg prices were 65.7 cents per dozen.

The All Farm Products Index of Prices Received in August was 107 based on 1990-92=100, unchanged from July. Price increases from July for wheat, lettuce, milk, and peaches more than offset price decreases for hogs, soybeans, strawberries, and cauliflower. However, the seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower relative seasonal marketings of wheat, hay, milk, and broilers more than offset the effect of relatively higher seasonal marketings of tobacco, cattle, grapes, and sweet corn, resulting in no change in the overall index.

Compared with August 1996, the All Farm Products Index was 10 points (8.5 percent) lower. Price decreases from August 1996 for corn, milk, wheat, and soybeans more than offset price increases for calves, cattle, hay, and lemons.

UNITED STATES INDEX SUMMARY

[1] District data funded by the Montana Wheat & Barley Committee. [2] Preliminary.

WHEAT & BARLEY MOVEMENT DECREASED 31% FROM LAST YEAR

Wheat shipped to out-of-state destinations during the December 1996-May 1997 period, at 72.1 million bushels, was 31% lower than the same period last year.

Shipments to eastern destinations totaled 1.6 million bushels, compared with 9.1 million bushels last year.

Movement to the west was 67.3 million bushels down 23% from a year earlier. Other destinations, mostly to the south, received 3.3 million bushels down 54% from last year. Rail movement amounted to 67.7 million bushels, 94% of total shipments.

Montana barley shipped to out-of-state destinations, December 1996-May 1997, was 11.4 million bushels, down 44% from the same period last year. Shipments to western destinations were down 55% from the same period last year, at 6.8 million bushels. Eastern destination shipments totaled 4.2 million bushels down 2% from last year.

Shipments to other destinations were down from last year's at 0.9 million bushels to 0.4 million bushels this year. Barley hauled by rail was 86% of total movement down from 93% for the same period last year.

U.S. CATTLE ON FEED UP 16 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 8.79 million head on August 1, 1997. The inventory was 16 percent above August 1, 1996.

Placements in feedlots during July totaled 2.0 million, 14 percent above 1996. Net placements were 1.94 million. During July, placements of cattle and calves weighing less than 600 pounds were 360,000, 600-699 pounds were 379,000, 700-799 pounds were 644,000, and 800 pounds and greater were 612,000.

Marketings of fed cattle during July totaled 2.11 million, 6 percent above 1996 Other disappearance totaled 57,000 during July, 8 percent below the previous year.

JULY EGG PRODUCTION

U.S. egg production totaled 6.45 billion during July 1997, up slightly from the 6.44 billion produced in 1996. Production included 5.40 billion table eggs and 1.05 billion hatching eggs, of which 989 million were broiler-type and 58.0 million were egg-type. The total number of layers during July 1997 averaged 299 million, up 1 percent from the average number of layers during July 1996. July egg production per 100 layers was 2,155 eggs, compared with 2,180 in July 1996.

All layers in the U.S. on August 1, 1997, totaled 300 million, up 1 percent from a year ago. The 300 million layers consisted of 243 million layers producing table or commercial type eggs, 54.2 million layers producing broiler-type hatching eggs, and 2.46 million layers producing egg-type hatching eggs. Rate of lay per day on August 1, 1997, averaged 69.6 eggs per 100 layers, down 1 percent from the 70.2 a year ago.

Laying flocks in the 30 major egg production States produced 6.11 billion eggs during July, up fractionally from July 1996. The average number of layers during July, at 284 million, was up 1 percent from a year earlier.

U.S. JULY MILK PRODUCTION UP 4.8 PERCENT

Milk production in the 20 major States during July totaled 11.5 billion pounds, up 4.8 percent from production in these same States in July 1996. June revised production, at 11.4 billion pounds was up 4.4 percent from June 1996.

Production per cow in the 20 major States averaged 1,480 pounds for July, 80 pounds above July 1996. The number of cows on farms in the 20 major States was 7.75 million head, 8,000 head less than July 1996 but 9,000 head more than June 1997.

MONTANA RED MEAT PRODUCTION DOWN, U.S. BEEF PRODUCTION SET RECORD HIGHS

Montana slaughter plants produced 1.4 million pounds, dressed weight, of red meat during July 1997, down 13 percent from July 1996. However, meat production was up 21 percent from the previous month. Cattle slaughter totaled 1,500 head, 200 head less than a year ago. The average live weight, at 1,147 pounds, was down 31 pounds from last year.

During July, there were 2,000 hogs slaughtered, 100 less than last year. The average live weight, at 218 pounds, was equal to a year ago. The number of sheep slaughtered, at 300 head, was the same as the previous year. The average live weight increased 11 pounds from last year to 124 pounds.

Commercial red meat production for the United States totaled 3.66 billion pounds during July, up 2 percent from the previous record high set in 1996. Beef production, at 2.26 billion pounds, was up 3 percent from the previous record high set in 1996. Cattle slaughter totaled 3.18 million head, up 1 percent from a year earlier. The average live weight was up 15 pounds from the previous year, at 1,178 pounds. Veal production totaled 27.0 million pounds, down 16 percent from a year earlier. Calf slaughter totaled 133,900 head, down 17 percent from last year. The average live weight was up 3 pounds to 336 pounds.

U.S. pork production, at 1.35 billion pounds, was up 1 percent from the previous year. Hog kill totaled 7.31 million head, just below a year ago. The average live weight was up 2 pounds from the previous year at 253 pounds.

Lamb and mutton production totaled 20.0 million pounds, up 1 percent from last year. Sheep slaughter totaled 306,300 head, 6 percent below the previous year. The average live weight was up 9 pounds to 134 pounds.

January - July red meat production was 24.8 billion pounds, down 2 percent from the comparable figure a year earlier. Accumulated beef production was down 2 percent, veal was down 9 percent, pork was down 2 percent, and lamb and mutton was down 4 percent.

ALL HIRED WORKERS UP 5 PERCENT, WAGES UP 5 PERCENT FROM LAST JULY

U. S. farm and ranch operators had 1.41 million hired workers on their farms and ranches during the week of July 6-12, 1997 which is 5 percent more than last year. The number hired directly by farm operators amounted to 1.07 million. Agricultural service employees on farms and ranches made up the remaining 340,000 workers. Migrant workers accounted for 10.8 percent of the hired workforce, compared to 13.1 percent a year ago.

Farm operators paid their hired workers an average wage of $6.90 per hour during the July 1997 survey week, up 35 cents from a year earlier. Field workers received an average of $6.45 per hour, up 29 cents. Livestock workers earned $6.54 per hour compared with $6.20 a year earlier.

See table on inside page.

INTERNET ACCESS UTILIZED BY 15 PERCENT OF MONTANA FARMS

Montana producers are leading the way with both access to computers and usage of the Internet according to a recent Montana Agricultural Statistics survey. Fifty-four percent of Montana's 23,000 farms and ranches have access to a computer and 15 percent of the producers use the Internet. Forty-one percent of Montana farms own or lease computers, and 33 percent use a computer for their farm business.

Thirteen percent of U.S. farms have Internet access. Internet access ranges from 4 percent in Louisiana and Mississippi to 31 percent in New Jersey. Thirty-one percent of U.S. farms own or lease computers, and 20 percent use a computer for their farm business.

A nationwide survey is conducted every June to provide estimates of crop acres planted, grain in storage, livestock inventories, and land values. This year, questions were added to the survey form that asked the operator about access and use of computers. The computer usage estimates are based on responses from nearly 34,000 U.S. agricultural operations and represent all sizes and types of farms. Montana's sample size was about 750 producers.

Also, see table on back page.

AUGUST 1 CROP PRODUCTION FORECAST

The estimated August 1 production for spring wheat and winter wheat remains unchanged from a month ago. Montana producers expect to produce 55.5 million bushels of winter wheat with yields averaging 37 bushels per acre. If realized this would be a 5 bushel increase from last year, while total production would be down over 12% due to the decrease in acreage harvested. The crop condition was rated mostly fair to good as of August 1. Harvest is progressing ahead of normal with 61% of the crop combined by the 10th.

Other spring wheat production is forecast at 117.6 million bushels, up 10% from last year, with yields expected to average 28 bushels per acre, up 2 bushels from last year. If realized this would be the second largest other spring wheat crop on record. Harvest has just begun on spring wheat with 4% of the crop combined by the 10th with the condition also rated mostly fair to good. Durum wheat producers have increased their expected yield to 25 bushels per acre, up 4 from the last forecast and equaling last year. Total durum production is forecast up 15% from a year ago totaling 7.75 million bushels. Some much needed rain fell since the last forecast helping yield potential in the Northeast where most of the durum is grown.

Barley producers are also expecting a slightly better crop with yields expected to be 54 bushels per acre, up 2 from last month and up 11 bushels from last year. Total production is set at 64.8 million bushels up nearly 26% from last year. Oat production is forecast slightly higher than last month with production forecast at 3.85 million bushels nearly doubling last year's production due to an increase in acreage and higher yields. Oat yields are expected to average 55 bushels per acre, up 3 bushels from last month's forecast and up 15 from last year.

Corn production in Montana is estimated at 1.95 million bushels down 5% from last year. Yields are expected to average 130 bushels per acre, down 7 from last year. Forecasted dry bean yield is set at 2,200 pounds per acre with total production set at 257,000 cwt., up 9% from last year. Sugar beet production is forecast at 1.24 million tons, down 5% from last year.

Montana hay producers are expecting better alfalfa yields this year. The expected yield is 2.5 tons per acre, up from 2.1 tons last season. Total production is forecast at 4.375 million tons, up 23% from last year. Other hay production is estimated at 1.36 million tons, up slightly from last year.

At the U.S. level, all wheat production is placed at 2.53 billion bushels, up 4% from the last forecast and 11% more than in 1996. The U.S. yield is now forecast at 39.9 bushels per acre, up 1.6 bushels per acre from last month and a new record high. The final winter wheat production forecast is 1.86 billion bushels, up 4% from last month and 26% higher than 1996. The U.S. yield is forecast at a record high 44.6 bushels per acre, up 1.8 bushels from July 1. Grain area was not changed from last month.

Durum wheat production is forecast at 90.2 million bushels, up 11% from last month, but still well below last year. August 1 conditions in the northern Durum states have increased yield expectations in the Dakotas and Montana. The U.S. yield is now forecast at 28.1 bushels per acre, up 2.9 bushels per acre from July 1. Other spring wheat production is forecast at 585 million bushels, up 3% from a month ago. Based on August 1 conditions, the U.S. yield is forecast at 31.3 bushels per acre. This is 0.9 bushels per acre better than July 1. There were no area changes. Hard Red Spring production is up 3% from July at 528 million bushels and White Spring production is up 1%.

U.S. barley production is forecast at 380 million bushels, up 2% from July, but down 4% from 1996. Yields are expected to average 59.4 bushels per acre, up 1.3 bushels from July and 0.9 bushels from 1996. U.S. oat production for 1997 is forecast at 187 million bushels, up 2% from the July "Crop Production" report and up 21% from 1996. If realized, this would be the third lowest oat production since records were first kept in 1866. The forecasted yield, at 58.1 bushels per acre, is up 1.4 bushels from July and up 0.3 bushels from the previous year. U.S. corn production is forecast at 9.28 billion bushels, virtually unchanged from last year but up 26% from 1995. Based on August 1 conditions, yields are expected to average 125.3 bushels per acre, down 1.8 bushels from a year ago. Acreage for harvest is estimated at 74.0 million acres, up 1% from 1996.

Production of dry edible beans is forecast at 29.2 million cwt for 1997, up 7% from a year earlier, but down 5% from two years ago. Production is expected to be at or above 1996 levels in all states except Nebraska and North Dakota. Planted area is estimated at 1.91 million acres, 6% above 1996, but 8% below 1995. Sugar beets production for the U.S. is expected to total 29.7 million tons, an increase of 11% from 1996.

All hay production for 1997 is forecast at 154 million tons, up 3% from 1996 ,but down slightly from 1995. U.S. alfalfa and alfalfa mixtures production is forecast at 77.8 million tons, 2% below last year and 8% below 1995. All other hay production for the U.S. is forecast at 76.1 million tons, 9% above the year earlier.

MONTANA AGRICULTURAL PRICES RECEIVED FOR JUNE MOSTLY LOWER

Montana crop prices for the full month of June were lower with the exception of feed barley. Winter wheat dropped 19 cents to $4.04 per bushel, durum wheat declined 21 cents to $4.20 per bushel. Spring wheat went down 18 cents to $3.99 per bushel. Feed barley increased 4 cents per bushel to $2.27, but malt barley declined 33 cents to $2.97 per bushel. At $1.65 per bushel, oats averaged 15 cents lower than the previous month. The all wheat price for mid-July averaged $3.76 per bushel and the all barley price was $2.19. June full month prices for alfalfa hay fell $17.00 to average $84.00 per ton. Other hay, at $71.00, dropped $18.00 per ton from the previous month.

Livestock prices for the full month of June were mostly lower than the previous month with the exception of sheep. Steers and heifers saw a $5.00 decrease to $72.40 per cwt. Cows were down $2.10 to $39.60 and the average price for calves fell $5.00 to $79.30 per cwt. Sheep increased $3.80 to $37.20 per cwt, while lambs dropped $10.10 to $92.90 per cwt. Milk prices decreased $1.30 to $12.10 per cwt. Steer and heifer prices for mid-July averaged $73.40 per cwt.

Nationally, steer and heifer prices averaged $64.90 per cwt for the full month of June. Cow prices came in at $37.50 and hogs were $57.80 per cwt. The U.S. all wheat price was $3.52 per bushel and $2.25 per bushel for all barley. Egg prices were 59.7 cents per dozen.

The All Farm Products Index of Prices Received in July was 107 based on 1990-92=100, down 1 point (0.9 percent) from June. Price decreases from June for wheat, hay, cantaloupes, and corn more than offset price increases for broilers, eggs, lettuce, and celery. The seasonal changes in the mix of commodities farmers sell also affect the overall index level, however, these changes were essentially offsetting in July.

Compared with July 1996, the All Farm Products Index was 12 points (10 percent) lower. Price decreases from July 1996 for corn, wheat, milk, and grain sorghum more than offset price increases for cattle, calves, hay, and lettuce.

FARM NUMBERS AND LAND IN FARMS

There are an estimated 23,000 farms in Montana, up 1,000 from a year ago. Virtually all the increase was made up by an increase in small sized farms. Land in farms fell 100,000 acres to 59.6 million acres. The average size of farm is 2,591 acres.

The number of farms in the United States in 1997 is estimated at 2.06 million, down less than one percent from 1996. Total land in farms is 968 million acres, also down less than one percent from last year. This decline in farm numbers and land in farms continues to follow historical trends. The average farm size was unchanged from 1996 at 470 acres.

The West and Northeast Regions were both up in farm numbers from 1996. The West Region showed the largest increase up 2,000 farms or 0.7%, while the Northeast was up 300 farms or 0.2% from 1996. The largest decrease was in the South with a loss of 3,800 farms or 0.4%. The North Central Region was down 3,500 farms or 0.4%.

Texas remained the State with the most farms at 205,000, the same as a year earlier. Missouri was second with 102,000 farms, down 2,000 from last year, followed by Iowa with 98,000 farms, the same as 1996.

Eight States increased in farm numbers while 14 states decreased from a year ago. California showed the largest increase with 2,000 farms while Indiana, Montana, Ohio, and Oklahoma showed increases of 1,000 farms from last year. Missouri showed the largest decrease, 2,000 farms.

Texas continued to lead the nation in land in farms and ranches with 129.0 million acres, the same as 1996. Four states with decreases of 200,000 acres in agricultural land from a year ago were Arkansas, Louisiana, North Carolina, and New Mexico. There were nine states with decreases of 100,000 acres in agricultural land from a year ago. There were no states that increased acres in agricultural land in farms from a year ago.

The number of U.S. farms in the economic sales class between $1,000 and $9,999 increased from 1,021,110 in 1996 to 1,032,510 in 1997. Those with sales in the $10,000-$99,999 group decreased from 705,100 to 678,500. The $100,000 and over sales group increased from 337,700 to 347,900 farms.

Estimates for the number of farms and land in farms refer to June 1. A farm is defined as "any establishment from which $1,000 or more of agricultural products were sold or would normally be sold during the year."

Egg Production

UNITED STATES JULY 1 CATTLE AND CALF INVENTORY DOWN 2 PERCENT

All cattle and calves in the United States as of July 1, 1997, totaled 108.8 million head, 2 percent below the 111.5 million on July 1, 1996 and 4 percent below the 113.0 million two years ago. All cattle and calves on feed for slaughter, at 10.9 million, were up 11 percent from last year, but down 3 percent from two years ago.

All cows and heifers that have calved, at 44.0 million, were 2 percent below the 45.0 million on July 1, 1996 and 4 percent below the 45.6 million two years ago. Beef cows, at 34.7 million, were down 3 percent from July 1, 1996 and 4 percent below two years ago. Milk cows, at 9.30 million, were down 1 percent from July 1, 1996 and 2 percent below two years ago.

Other class estimates on July 1, 1997, and the changes from July 1 last year and two years ago, respectively, are as follows:

- All heifers 500 pounds and over, 17.1 million, down 1 percent and down 3 percent. - Beef replacement heifers, 5.3 million, down 4 percent and down 7 percent.
- Milk replacement heifers, 3.6 million, down 3 percent and down 8 percent.
- Other heifers, 8.2 million, up 1 percent and up 3 percent.
- Steers weighing 500 pounds and over, 14.6 million, down 3 percent and down 5 percent.
- Bulls weighing 500 pounds and over, 2.3 million, down 4 percent from both years.
- Calves under 500 pounds, 30.8 million, down 3 percent and down 4 percent.

The 1997 calf crop is expected to be 38.8 million, down 2 percent from 1996 and down 4 percent from 1995. Calves born during the first half of the year are estimated at 28.5 million, down 2 percent from 1996 and down 3 percent from 1995.

JULY U.S. ALL SHEEP AND LAMBS TOTAL 9.90 MILLION HEAD

All sheep and lamb inventory in the United States on July 1, 1997, totaled 9.90 million head, 4 percent below July 1, 1996. Total breeding sheep and lambs reached 5.78 million head, 6 percent below July 1996. Of the July 1, 1997 breeding herd, 4.80 million head were ewes one year old and older, 230,000 head were rams one year old and older, and 750,000 head were replacement lambs.

Market sheep and lambs, at 4.13 million head, were slightly below July 1996. Of the total market lambs, 61.7 percent were under 65 pounds, 20.3 percent were 65 to 84 pounds, 11.4 percent were 85 to 105 pounds, and the remainder, 6.6 percent, were over 105 pounds on July 1.

The 1997 lamb crop in the United States is expected to total 4.95 million head, down 6 percent from the 1996 lamb crop of 5.30 million head. Lambs born during January through June 1997 reached 4.36 million head or 88 percent of the yearly total. An additional 590,000 head are expected to be born during the period July through December 1997.

The July 1 sheep and lamb numbers are published by regions. Montana is included with Colorado, South Dakota, Utah and Wyoming. The total number of sheep and lambs in the region was 3.4 million head, down 4 percent from a year ago. This region accounted for 34.3 percent of the total U.S. sheep and lambs.

The region's breeding sheep and lambs inventory was 1.9 million head, down 4 percent from last year. Of the total breeding sheep and lambs, 1.6 million head were ewes one year old and older, 55,000 head were rams one year old and older, and 225,000 head were replacement lambs.

All market sheep and lambs for the region totaled 1.6 million head, down 4 percent from a year ago. Of the total market lambs, 72.1 percent were under 65 pounds, 13.1 percent were 65 to 84 pounds, 6.6 percent were 85 to 105 pounds, and the remaining 8.2 percent were over 105 pounds.

Lambs born during January and June 1997 in the region reached 1.6 million head. An additional 20,000 are expected to be born during the period July through December 1997.

U.S. CATTLE ON FEED UP 14 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 8.96 million head on July 1, 1997, 14 percent above July 1, 1996. The inventory included 5.41 million steers and steer calves, up 8 percent from the previous year. This group accounts for 60 percent of the total inventory. Heifers and heifer calves accounted for 3.50 million head, up 26 percent from 1996.

Placements in feedlots during June totaled 1.44 million, 11 percent above 1996. **Net placements** were 1.38 million. During June, placements of cattle and calves weighing less than 600 pounds were 308,000, 600-699 pounds were 338,000, 700-799 pounds were 460,000, and 800 pounds and greater were 338,000.

Marketings of fed cattle during June totaled 2.04 million, 2 percent above 1996. The year-to-year relationship between fed cattle marketed and commercial slaughter continues to be affected by the decrease in cattle imported from Canada that are going directly to slaughter. **Other disappearance** totaled 60,000 during June, 14 percent below the previous year.

MONTANA RED MEAT PRODUCTION DOWN, BUT U.S. RED MEAT PRODUCTION UP FOR JUNE

Montana slaughter plants produced 1.1 million pounds, dressed weight, of red meat during June 1997, down 18 percent from June 1996. Cattle slaughter totaled 1,300 head, 300 head less than a year ago. The average live weight, at 1,150 pounds, was down 47 pounds from a year ago.

During June, there were 1,500 head of hogs slaughtered, unchanged from a year ago. The average live weight decreased a pound to 219 pounds. Sheep slaughter was the same as a year earlier at 100 head, however, the average live weight increased 12 pounds to 124 pounds.

Commercial red meat production for the United States totaled 3.49 billion pounds during June, up 2 percent from the previous year. Beef production, at 2.13 billion pounds, was down 2 percent from the previous year. Cattle slaughter totaled 3.06 million head, down 3 percent from a year earlier. The average live weight was equal to last year, at 1,160 pounds.

Veal production totaled 26.0 million pounds, down 8 percent from a year earlier. Calf slaughter totaled 119,100 head, down 12 percent from the previous year. The average live weight was up 14 pounds to 361 pounds.

Pork production, at 1.31 billion pounds, was up 9 percent from a year ago. Hog kill totaled 7.00 million head, 7 percent above a year earlier. The average live weight was up 2 pounds from the previous year at 256 pounds. Lamb and mutton production totaled 21.0 million pounds, up 16 percent from a year earlier. Sheep slaughter totaled 303,300 head, 7 percent above the previous year. The average live weight was up 9 pounds to 138 pounds.

U.S. PELT PRODUCTION DOWN 1 PERCENT

Mink pelt production in the United States in 1996 totaled 2.65 million pelts, down 1 percent from 1995. Wisconsin, the major mink producing State, produced 718,000 pelts. By color class, the number of pelts as a percent of the total U.S. production follows: Standard - 46.7 percent; Mahogany - 21.1 percent; Gunmetal - 12.8 percent; Ranch Wild - 7.4 percent; Demi-buff - 4.1 percent. The remaining color classes accounted for 7.9 percent.

Mink pelts produced during the 1996 crop year were valued at $93.5 million dollars, down 35 percent from $142.8 million a year ago. The average price per pelt for the 1996 crop year was $35.30, down from the record high price of $53.10 in 1995.

Female mink bred to produce kits in 1997 totaled 710,800, up 5 percent from the previous year. Percent of total females bred to produce kits in 1997 by color class are: Standard - 46.5 percent; Mahogany - 19.5 percent; Gunmetal - 12.8 percent; Ranch Wild - 6.7 percent; Sapphire - 4.5 percent. The remaining color classes accounted for 10.0 percent.

There were 415 mink farms producing pelts in 1996, down 7 percent from a year ago. Leading States were Utah with 130 farms, Wisconsin with 74 farms and Minnesota with 40. There were 40 mink farms which also raised fox in 1996, compared to 49 for the previous year.

1997 MONTANA WHEAT AND BARLEY VARIETIES SURVEY

Neeley continued to be the leading variety of **winter wheat** seeded in Montana for the tenth consecutive year with over 375 thousand acres planted in the state. It is a hard red, semi-dwarf winter wheat that generally has 1 to 3 percent lower protein than most recommended hard red winter wheats. Neeley has satisfactory milling and baking qualities.

Rocky moved up to second place this year from its third place position a year ago with over 300 thousand acres planted.

Tiber traded places with Rocky to fall to third place this year. It accounted for slightly more than 13 percent of the winter wheat planted in the state, down more than 130 thousand acres from last year.

Amidon maintained its number one **spring wheat** position for the sixth consecutive year although producers planted 100 thousand fewer acres than in 1996. It accounts for almost 25 percent of the seeded spring wheat in Montana, and over half the Amidon acreage was seeded in the Northeast district. A hard red spring wheat, Amidon's baking qualities are rated as superior with satisfactory milling qualities.

McNeal was the most popular newly discovered variety, increasing its percent planted from 1.3 in 1996 to 16 percent this year. Developed in Montana and released in 1995, McNeal has superior yield and average protein levels.

Westbred Rambo dropped a place to third after seven consecutive years as the second most popular spring wheat in the state. Accounting for almost 10 percent of the statewide seeded spring wheat acreage, more than 85 percent of Westbred Rambo was seeded in the North Central district of the state.

Kyle maintained its position as the top **durum** variety for the fourth year, doubling its seeded acreage from last year with over 120 thousand acres planted. Developed in Canada and released in 1984, it is resistant to prevalent races of leaf and stem rust. It has an overall quality rating of good.

Monroe remained in the second place position this year, although acres seeded dropped by over 12 thousand acres. Monroe accounting for 14 percent of the durum acreage, down from 20 percent in 1996.

Medora increased its percent planted from 2 percent in 1996 to over 8 percent this year, making it the third most popular durum wheat.

Harrington was the top **malting-type barley variety** planted. It accounted for one third of all varieties planted and over three quarters of the varieties recommended by the American Malting Barley Association.

Baronesse stayed in the top position among **feed-type barleys** from last year. It accounted for over 15 percent of the barley seeded and over one fourth of the feed-type barley.

MONTANA WHEAT & BARLEY VARIETIES

Montana's wheat and barley varieties report was made possible with funds provided by the Montana Wheat & Barley Committee and the American Malting Barley Association, Inc. A more detailed report may be obtained from our office upon request.

[1] Revised. [2] Soft White Wheat. [3] American Malting Barley Association, Inc. recommended for malting and brewing for Montana.

MONTANA AND U.S. APRIL-JUNE MILK PRODUCTION UP

Montana milk cows produced 78 million pounds of milk during the period of April-June 1997, compared with 77 million the same quarter a year ago. Even though there was a one percent increase in milk production, milk cow inventory declined from 20,000 head a year ago to 19,000 head this year.

The daily amount of grain and other concentrates fed to Montana's milk cows on July 1, amounted to 17.2 pounds per cow, down 0.6 pounds from last year. The value of the grains and other concentrates fed, at $8.30 per cwt, decreased a dollar from last year.

During the April-June period, the U.S. produced 40.6 billion pounds of milk, 2 percent above the April-June period last year. The average number of milk cows in the U.S. during the April-June quarter was 9.25 million head, 117,000 head less than the same period last year.

Grain and other concentrates fed to milk cows on July 1, 1997, averaged 19.0 pounds, up 0.7 pounds from July 1, 1996, but down 0.5 pounds from April 1, 1997. The value of grain and other concentrates fed to milk cows on July 1, 1997 averaged 8.73 per cwt, $1.14 less than the price on July 1, 1996.

U.S. JUNE EGG PRODUCTION UP 2 PERCENT

U.S. egg production totaled 6.27 billion during June 1997, up 2 percent from the 6.17 billion produced in 1996. Production included 5.25 billion table eggs and 1.02 billion hatching eggs, of which 958 million were broiler-type and 57.0 million were egg-type. The total number of layers during June 1997 averaged 299 million, up 2 percent from the average number of layers during June 1996. June egg production per 100 layers was 2,092 eggs, compared with 2,099 in June 1996.

All layers in the U.S. on July 1, 1997, totaled 299 million, up 2 percent from a year ago. The 299 million layers consisted of 243 million layers producing table or commercial type eggs, 53.0 million layers producing broiler-type hatching eggs, and 2.52 million layers producing egg-type hatching eggs. Rate of lay per day on July 1, 1997, averaged 69.5 eggs per 100 layers, down 1 percent from the 70.3 a year ago.

Laying flocks in the 30 major egg production States produced 5.94 billion eggs during June, up 2 percent from June 1996. The average number of layers during June, at 284 million, was up 2 percent from the year earlier.

HIGHLIGHTS:

July 1 Crop Production Forecast
Potato Production
Ag Prices Received
U.S. Wheat Supply, Disappearance, and Price

JULY 1 CROP PRODUCTION

Montana wheat producers are expecting the third largest wheat crop on record. As of July 1, producers expect to harvest 179.61 million bushels of all wheat this year, 2 percent more than last year's crop. Growers expect to harvest 6.01 million acres of wheat, which would be the second largest harvested acreage on record. Forecasted yield for winter wheat is up 2 bushels from last month's forecast to 37 bushels per acre, this would be 5 bushels higher than last year. Good moisture throughout the main winter wheat production areas has led to a better crop condition and increased yields. Total winter wheat production is estimated at 55.5 million bushels, down 12 percent from last year due to the decrease in acreage for harvest. Growers intend to harvest 1.5 million acres of winter wheat down 24 percent from last year.

Spring wheat producers plan to harvest 4.2 million acres, up 100,000 acres from last year. This would be the most other spring wheat harvested since 1953 when durum and other spring wheat were combined. Forecasted yield is set at 28 bushels per acre, up 2 bushels from last year. The eastern third of the state, which has suffered from drought-like conditions, pulled the state average yield down. Total production is estimated at 117.6 million bushels, up 10 percent from last year. This would be the second largest other spring wheat crop on record due mainly to the large acreage harvested. Durum wheat production is forecast at 6.51 million bushels, down 4 percent from last year. Yield is estimated at 21 bushels per acre, down 4 bushels from last year. A lack of moisture through July 1 hurt yield potential in the Northeast district where most of the durum is produced. Producers plan to harvest 310,000 acres up from 270,000 last year.

Barley yields are estimated at 52 bushels per acre, which, if realized, would be 9 bushels higher than last year. Total production is forecast at 62.4 million bushels up 21 percent from 1996. Growers expect to harvest 1.2 million acres unchanged from 1996. Oat production is set at 3.64 million bushels, nearly twice last year's production of 2.0 million bushels. Yield is estimated at 52 bushels per acre, up 12 bushels per acre from 1996. Growers plan to harvest 70,000 acres up 20,000 acres from a year ago.

U.S. all wheat production is forecast at 2.43 billion bushels, up 7 percent from 1996. Based on July 1 conditions, the U.S. yield is forecast at 38.3 bushels per acre. This is up 2.0 bushels from last year, largely due to a tremendous increase in winter wheat production.

U.S. winter wheat production is forecast at 1.78 billion bushels, up 11 percent from last month and 20 percent higher than 1996. Based on July 1 conditions, the U.S. yield is forecast at a record high 42.8 bushels per acre. This is up 3.5 bushels from June 1 and 5.6 bushels per acre better than last year. Hard Red Winter wheat production is up 141 million bushels from last month largely due to increases in acreage to be harvested and improved yields. The Kansas yield is a new record. Soft Red Winter, at 455 million, is also up from a month ago and is near 1995 levels. Illinois and Missouri growers are now expecting record high yields.

Other spring wheat production is forecast at 569 million bushels, down 17 percent from 1996. Based on July 1 conditions, the U.S. yield is forecast at 30.4 bushels per acre. This is 4.7 bushels per acre below last year. Grain area totals 18.7 million acres, down 5 percent. Hard Red Spring production is down 18 percent from last year at 513 million bushels. White Spring production is down 7 percent. Durum wheat production is forecast at 80.9 million bushels, down 30 percent from 1996. Lower expected yields are the main cause of the decline. Based on July 1 conditions, the U.S. yield is forecast at 25.2 bushels per acre. This is down 7.5 bushels per acre from last year and the lowest average since 1989.

U.S. oat production for 1997 is forecast at 183 million bushels, up 18 percent from last year. If realized, this would be the third lowest oat production since records were first kept in 1866. The forecasted yield, at 56.7 bushels per acre, is down 1.1 bushels from last year's 57.8 bushels. Area harvested and to be harvested, at 3.22 million acres, is up 20 percent from 1996. This also would be the third lowest oat acreage harvested for grain on record.

Barley production is forecast at 372 million bushels, down 6 percent from a year ago, but up 3 percent from 1995. Yields are expected to average 58.1 bushels per acre, down 0.4 bushels from last year. Area harvested and to be harvested, at 6.40 million acres, is 6 percent below the 6.79 million acres harvested the previous year.

POTATO PLANTED AND HARVESTED ACRES - JULY 1, 1997

Montana potato producers planted an estimated 10,400 acres this year unchanged from a year ago. Currently, growers plan on harvesting all acres. Potato farmers across the United States have planted an estimated 1.37 million acres of potatoes in all four 1997 seasons, down 6 percent from last year and 2 percent below 1995. Area for harvest is forecast at 1.35 million acres, down 5 percent from a year ago and 2 percent below two years ago. Winter plantings were up 8 percent, spring dropped 6 percent, summer fell 13 percent, and fall, with 88 percent of total U.S. acreage, declined 6 percent. Area planted to fall potatoes in 1997 is estimated at 1.20 million acres, down 6 percent from last year's record high and 2 percent below 1995. Harvest is expected from 1.18 million acres, 5 percent less than a year ago and 2 percent under 1995.

[1/] District estimates of stocks funded by the Montana Wheat & Barley Committee.

AGRICULTURAL PRICES RECEIVED FOR MAY

Montana winter wheat increased 12 cents to $4.23 per bushel, durum wheat increased 28 cents to $4.41 per bushel. Spring wheat went up 1 cent to $4.17 per bushel. Feed barley increased 1 cent per bushel to $2.23 and malt barley increased 17 cents to $3.30 per bushel. At $1.80 per bushel oats averaged 20 cents lower than the previous month on limited movement during May. The all wheat price for mid-June averaged $3.92 per bushel and the all barley price was $2.53. The price for alfalfa hay in June, at $84.00 per ton, is down $17.00 from last month. The June other hay price decreased $18.00 since May to $71.00 per ton.

Livestock prices for the full month of May were mixed from last month. Steers and heifers saw a $3.30 increase to $77.40 per cwt. Cows increased 30 cents $41.70 and the average price for calves rose 40 cents to $84.30 per cwt. Sheep decreased $4.20 to $33.40 per cwt while lambs increased $3.00 to $103.00 per cwt. Milk prices decreased 40 cents to $13.40 per cwt. Steer and heifer prices for mid-June averaged $74.90 per cwt.

Nationally, steer and heifer prices averaged $68.30 per cwt for the full month of May. Cow prices came in at $38.20 and hogs were $58.20 per cwt. The U.S. all wheat price was $4.09 per bushel and $2.31 per bushel for all barley. Egg prices were 64.3 cents per dozen.

The All Farm Products Index of Prices Received in June was 107 based on 1990-92=100, down 1 point (0.9 percent) from May. Price decreases from May for cattle, milk, wheat, and cantaloupes more than offset price increases for lettuce, strawberries, lemons, and broilers. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Higher seasonal marketings of wheat, grapes, hay, and cantaloupes more than offset the relatively lower marketings of oranges, tomatoes, strawberries, and cattle. These changes in marketings limited the decline in the index.

Compared with June 1996, the All Farm Products Index was 11 points (9.3 percent) lower. Price decreases from June 1996 for corn, wheat, milk, and broilers more than offset price increases for cattle, soybeans, hay, and calves.

PROJECTED U.S. WHEAT STOCKS

Projected U.S. 1997/98 ending stocks are up 71 million bushels from last month as a 127-million-bushel rise in the crop more than offsets expanding use. Winter wheat production is forecast up 177 million bushels from last month because of higher area and yields. The forecast for spring wheat (including durum), however, is lower. Also, with the U.S. durum crop down 30 percent from last year, projected imports are up 10 million bushels from last month. Partially offsetting the larger all-wheat supplies are lower reported carryin stocks than forecast last month, and a rise of 25 million bushels each for domestic use and exports. Still, ending stocks are substantially higher and the projected price range is reduced 35 cents on each end to $3.10 to $3.70 per bushel.

JUNE 1, 1997 PLANTED ACREAGE

Montana producers planted a record 4.35 million acres of spring wheat this year, up 150,000 acres from last year. The decrease in winter wheat acreage lead to this record spring wheat crop. Producers plan to harvest 4.2 million acres. Most areas of the state have adequate moisture for the crop except for some areas in the eastern part of the state. A lack of good moisture last fall held winter wheat seedings back. Winter wheat planted acreage is estimated at 1.6 million acres down 450,000 acres from the previous year. Winter kill caused quite a few acres to have to be reseeded. Currently, producers plan to harvest 1.5 million acres. Durum wheat planted acreage is estimated at 320,000 acres with 310,000 acres for harvest. This is a slight increase from a year ago. For the fifth year in a row barley growers seeded 1.3 million acres. Harvested acreage is set at 1.2 million acres, unchanged from a year ago. There are an estimated 140,000 acres of oats seeded, up 40,000 acres from last year. Producers plan to harvest 70,000 acres, up 20,000 from a year ago.

Corn growers planted 50,000 acres of corn, down 5,000 from last year. Dry bean seedings are set at 11,500 acres, up from 10,500 last year with harvested acreage set at 11,300. There were 59,700 acres of sugar beets planted, 2,000 acres more than a year ago. Hay producers plan to harvest 1.75 million acres of alfalfa hay mixtures this year. Harvested acreage of other hay is set at 850,000 acres down slightly from a year ago. At the time of the June 1 Agricultural Survey CRP land had not been approved for haying.

At the U.S. level, winter wheat area for grain is now estimated at 41.6 million acres, up 2 percent from the June 1 forecast and 5 percent more than 1996. Planted acres are 48.3 million acres, still down 7 percent from last year, but fractionally higher than the previously published level. Other spring wheat area planted for 1997 is estimated at 19.2 million acres, down 4 percent from 1996. Area to be harvested for grain is expected to total 18.7 million acres, down 5 percent from last year. The 1997 durum wheat planted area is estimated at 3.27 million acres; grain area is expected to total 3.21 million acres. Both acreages are down 10 percent from 1996.

Barley seedings nationwide totaled 6.77 million acres, down 5 percent from last year. This is the second lowest acreage planted since records were first kept in 1926. The area to be harvested for grain is expected to total 6.40 million acres, also down 5 percent from the year earlier. Over half of the 27 barley estimating States showed a decline in planted acres from the previous year.

Oats planted nationwide totaled 5.26 million acres, up 13 percent from last year. Planted acreage rebounded somewhat from last year's record low, but this is still the second lowest acreage on record. Planted oats acreage has dropped in recent years as a result of oats not being needed as a cover crop for set aside acreage. Growers intend to harvest 3.22 million acres, up 20 percent from the 2.69 million acres harvested in 1996. If realized, this would be the third lowest oat harvested acreage on record.

Corn planted for all purposes is estimated at 80.2 million acres, up 1 percent from last year. This is the largest planted acreage since 1985. Growers expect to harvest 74.0 million acres for grain, up 1 percent from 1996. If realized, this will also be the largest harvested acreage since 1985. Planted acreage of dry edible beans is estimated at 1.90 million acres this year, up 5 percent from last year, but 8 percent below two years ago. Acreage for harvest is forecast at 1.81 million acres, 5 percent above a year ago, but 5 percent below 1995.

Sugar beet growers planted an estimated 1.46 million acres of sugar beets for 1997, up 7 percent from last year. Planted acres increased in almost all of the major sugar beet-producing States. Nationwide, growers plan to harvest an estimated [illegible] million acres, up 9 percent from last year.

Producers in the U.S. expect to harvest 60.8 million acres of hay in 1997, down slightly from the 61.0 million acres harvested the previous year. Alfalfa and alfalfa mixtures are expected to total 23.6 million acres, down 3 percent from 1996. All other hay is estimated at 37.3 million acres, 1 percent above last year. With record level hay prices and depleted hay stocks, the demand for hay has remained high. Weather related problems have reduced the availability of hay land in many areas.

The Montana crop acreage and grain stocks estimates in this issue of the Reporter are the result of surveying approximately 3,000 Montana farmers and ranchers during June. Names were selected on a statistical probability basis. SPECIAL THANKS to those operators that were interviewed and responded to the survey. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics.

JUNE 1, 1997 GRAIN STOCKS

Montana's June 1 all wheat stocks were estimated at 37.2 million bushels, up 35 percent from stock levels at this time in 1996. Winter wheat stocks were estimated at 8.83 million bushels, up 26 percent from last year. All spring wheat stocks were estimated at 28.37 million bushels, up 38 percent from a year ago, but down 14 percent from the 10-year average for this time. Durum wheat stocks totaled 3.27 million bushels, up from 800,000 bushels the previous year. Montana barley stocks on June 1 were estimated at 7.3 million bushels, down 700,000 bushels from June 1, 1996. Oat stocks, at 1.1 million bushels, are up 26 percent from last year.

U.S. old crop all wheat stored in all positions June 1, 1997 totaled 444 million bushels, up 18 percent from June 1, 1996. Durum wheat in all storage positions on June 1, 1997 totaled 31.6 million bushels, up 23 percent from last June 1. Barley stored in all positions on June 1, 1997, totaled 110 million bushels, 10 percent above stocks of June 1, 1996. Oats stored in all positions on June 1, 1997 totaled 66.6 million bushels, fractionally above the stocks of June 1, 1996.

MAY RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 1.1 million pounds, dressed weight, of red meat during May, 21 percent below last year, but 4 percent above last month. There were 1,400 head of cattle slaughtered last month, 200 head less than a year ago. The average live weight decreased 66 pounds from a year ago to 1,136 pounds.

The number of hogs slaughtered by Montana slaughter plants dropped 300 head from May 1996 to 1,300 head. The average live weight decreased 2 pounds to 222 pounds. There were 100 head of sheep and lambs slaughtered last month, the same as a year ago. Sheep and lambs averaged 125 pounds live weight, up 7 pounds from last year.

Commercial red meat production for the U.S. totaled 3.57 billion pounds during May, down 5 percent from the previous year.

Beef production, at 2.19 billion pounds, was down 5 percent from the previous year. Cattle slaughter totaled 3.18 million head, down 4 percent from a year earlier. The average live weight was down 7 pounds from the previous year, at 1,149 pounds. Veal production totaled 26.0 million pounds, down 14 percent from a year earlier. Calf slaughter totaled 116,400 head, down 15 percent from the previous year. The average live weight was up 6 pounds to 361 pounds.

Pork production, at 1.33 billion pounds, was down 6 percent from the previous year. Hog kill totaled 7.10 million head, 7 percent below a year earlier. The average live weight was up 2 pounds from the previous year at 256 pounds. Lamb and mutton production totaled 22.0 million pounds, up 3 percent from a year earlier. Sheep slaughter totaled 316,600 head, 2 percent below the previous year. The average live weight was up 7 pounds to 139 pounds.

MAY EGG PRODUCTION UP 3 PERCENT

U.S. egg production totaled 6.50 billion during May 1997, up 3 percent from the 6.34 billion produced in 1996. Production included 5.46 billion table eggs and 1.04 billion hatching eggs, of which 978 million were broiler-type and 64.0 million were egg-type. The total number of layers during May 1997 averaged 301 million, up 2 percent from the average number of layers during May 1996. May egg production per 100 layers was 2,157 eggs, compared with 2,153 in May 1996.

All layers in the U.S. on June 1, 1997, totaled 301 million, up 2 percent from a year ago. The 301 million layers consisted of 245 million layers producing table or commercial type eggs, 53.0 million layers producing broiler-type hatching eggs, and 2.68 million layers producing egg-type hatching eggs. Rate of lay per day on June 1, 1997, averaged 70.0 eggs per 100 layers, up 1 percent from the 69.5 a year ago.

Laying flocks in the 30 major egg production States produced 6.17 billion eggs during May, up 3 percent from May 1996. The average number of layers during May, at 286 million, was up 3 percent from the year earlier.

JUNE SWEET CHERRY FORECAST

On June 1, 1997 Montana's sweet cherry crop was forecast at 1,000 tons up 300 tons from last year. There was favorable weather this spring and not much loss of fruit during the June drop.

U.S. sweet cherry production is forecast at 191,250 tons, up 24 percent from 1996 and 16 percent above 1995. The three largest states, California, Oregon, and Washington expect an increase in production from last year.

The Washington crop, at 85,000 tons, is 23 percent more than last year. All major areas forecasted an increase from last year, and a good quality crop is expected. Weather was favorable for growing conditions in Washington and Oregon. Production in Oregon is forecast at 43,000 tons, up 34 percent from last year. The sweet cherry crop in California is forecast at 35,000 tons, up 42 percent from 1996. Good weather throughout the growing season resulted in better yields. The Michigan sweet cherry crop is forecast at 24,000 tons, up 9 percent from 1996, but down 11 percent from 1995. Bloom population was adequate, but cold weather hampered pollination. Cooler than normal temperatures also affected crop development in New York and Pennsylvania. Both states expect slight declines from a year ago.

U.S. HOG INVENTORY UP 2%

U.S. inventory of all hogs and pigs on June 1, 1997, was 58.2 million head. This was 2 percent above June 1996 and 4 percent above the March 1, 1997 inventory. Breeding inventory, at 6.95 million head is up 1 percent from June 1, 1996 and up 2 percent from March 1, 1997. Market hog inventory, at 51.2 million head was 2 percent above last year and 4 percent above last quarter.

The March-May 1997 U.S. pig crop at 25.5 million head was 2 percent more than 1996 but 3 percent less than 1995. Sows farrowing during this period totaled 2.95 million head, slightly below last year. Litter rate increases continue at a record level, with an average of 8.65 pigs saved per litter for the March-May period. Last year the litter rate averaged 8.47 pigs per litter. Pigs saved per litter by size of operation ranged from 7.60 for operations with 1-99 hogs to 8.80 for operations with more than 2,000 hogs and pigs.

U.S. hog producers intend to have 2.91 million sows farrow during the June-August 1997 quarter, 5 percent above the actual farrowings during the same period last year, but 2 percent lower than 1995. Intended farrowings for September-November 1997, at 2.89 million sows are 6 percent above 1996 and 3 percent above the 1995 period.

The total number of hogs under contract, owned by operations with over 5,000 head total inventory, but raised by contractees, accounted for 26 percent of the total U.S. hog inventory.

U.S. CATTLE ON FEED UP 12 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.61 million head on June 1, 1997. The inventory was 12 percent above June 1, 1996. Placements in feedlots during May totaled 1.89 million, 22 percent above 1996. Net placements were 1.78 million. During May, placements of cattle and calves weighing less than 600 pounds were 332,000, 600-699 pounds were 406,000, 700-799 pounds were 640,000, and 800 pounds and greater were 514,000. Marketings of fed cattle during May totaled 2.09 million, 2 percent above 1996. The year-to-year relationship between fed cattle marketed and commercial slaughter continues to be affected by the decrease in cattle imported from Canada that are going directly to slaughter. Other disappearance totaled 117,000 during May, 39 percent above the previous year.

U.S. MAY MILK PRODUCTION

Milk production in the 20 major States during May totaled 11.8 billion pounds, up 2.1 percent from production in these same states in May 1996. April revised production, at 11.5 billion pounds was up 1.7 percent from April 1996. Production per cow in the 20 major States averaged 1,526 pounds for May, 47 pounds above May 1996. The number of cows on farms and ranches in the 20 major States was 7.73 million head, 84,000 head less than May 1996 but 1,000 head more than April 1997.

MONTANA WINTER WHEAT PRODUCTION FORECAST UNCHANGED FROM MAY; U.S. UP 3 PERCENT

Montana winter wheat production, as of June 1, is estimated at 57.75 million bushels, unchanged from the May forecast. If realized, this year's winter wheat production will be down nearly 9 percent from 1996. Some much needed rain came in the last few weeks in the major winter wheat growing areas. Average yield is estimated at 35 bushels per acre, also unchanged from last month and, if realized, up 3 bushels from last year. Producers still plan to harvest 1.65 million acres, unchanged from last month but, if realized, acreage would be down nearly 17 percent from last year. As of June 7 the condition of the crop was rated 2% very poor, 9% poor, 32% fair, 53% good, and 4% excellent.

U.S. winter wheat production is forecast at 1.60 billion bushels, up 3 percent from last month and 8 percent higher than 1996. Based on June 1 conditions, the U.S. yield is forecast at 39.3 bushels per acre. This is up 1.1 bushels from May 1 and 2.1 bushels per acre better than last year. Grain area totals 40.8 million acres, unchanged from last month.

U.S. hard red winter wheat production is up 3 percent from last month's forecast at 921 million bushels. Improved Kansas and Oklahoma yields more than offset hard red winter wheat declines elsewhere. Soft red winter, at 422 million, is also up 3 percent and now about equal to last year's total. White winter wheat production is up from last month due to improved Washington yield expectations.

AGRICULTURAL PRICES RECEIVED FOR APRIL

Montana winter wheat increased 10 cents to $4.11 per bushel and spring wheat went up 13 cents to $4.16 per bushel, but durum wheat declined 15 cents to $4.13 per bushel. Feed barley decreased 20 cents per bushel to $2.22 and malt barley declined 3 cents to $3.13 per bushel. At $2.00 per bushel oats averaged 5 cents lower than the previous month. The all wheat price for mid-May averaged $4.10 per bushel and the all barley price was $2.54. The price for alfalfa hay in May, at $101.00 per ton, is down $13.00 from last month. The May other hay price decreased $6.00 since April to $89.00 per ton.

Livestock prices for the full month of April were mostly higher than the previous month with the exception of beef cattle and sheep. Steers and heifers saw a $1.60 increase to $74.10 per cwt. Cows increased $1.10 to $41.40 and the average price for calves rose $3.50 to $83.90 per cwt. Sheep decreased $4.90 to $37.60 per cwt. while lambs increased $1.10 to $100.00 per cwt. Milk prices increased 40 cents to $13.80 per cwt. Steer and heifer prices for mid-May averaged $78.90 per cwt.

Nationally, steer and heifer prices averaged $67.90 per cwt for the full month of April. Cow prices came in at $38.20 and hogs were $53.80 per cwt. The U.S. all wheat price was $4.11 per bushel and $2.27 per bushel for all barley. Egg prices were 65.8 cents per dozen.

The All Farm Products Index of Prices Received in May was 107 based on 1990-92=100, up 1 point (0.9 percent) from April. Price increases from April for hogs, cattle, strawberries, and lemons were offset by price decreases for milk, corn, broilers, and lettuce. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Higher seasonal marketings of cantaloupes, sweet corn, grapes, and wheat more than offset the relatively lower marketings of cattle, milk, cotton, and corn. These changes contributed virtually all of the one point increase in the overall index.

Compared with May 1996, the All Farm Products Index was 5 points (4.5 percent) lower. Price decreases from May 1996 for corn, wheat, milk, and potatoes more than offset price increases for cattle, soybeans, hay, and calves.

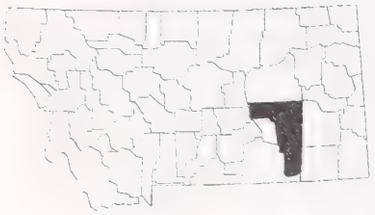
*featuring...*ROSEBUD COUNTY



Rosebud County was created in February 1901 and is located in the southeast corner of Montana. The Yellowstone River runs through the heart of the county. It is made up primarily of rangeland, both to the north and south of the River. However, the extreme southeastern corner is occupied by a portion of the Custer National Forest. The Northern Cheyenne Indian Reservation also occupies a portion of the southern tip of Rosebud County.

Because of its vast rangeland, the county is a prime livestock raising area. The county ranked 5th and 18th, respectively, for all cattle and calves and breeding sheep and lambs in the January 1, 1997 inventory. Hogs and pigs are also raised in the county.

Crops produced in the county include wheat, barley, oats, corn, and hay. Rosebud County ranked 5th in oats production, 25th in all wheat, and 37th in barley production for the 1996 crop year. All hay production ranked 26th for the 1995 crop year.

Cash receipts from livestock and livestock products amounted to $30,748,000. Crops returned $6,991,000 and government payments added $3,282,000 for a total cash receipts return of $41,021,000 in 1994.

1996 MILK PRODUCTION, DISPOSITION, AND INCOME

Montana's 1996 milk production, of 307 million pounds, decreased 3 percent from 1995. An average of 20,000 milk cows were on farms and ranches during the year, 1,000 less than a year ago. The rate per cow averaged 15,350 pounds, 350 pounds more than 1995.

Cash receipts from marketings of milk during the year in Montana were 44.7 million dollars, up 11 percent from 1995. Producer returns averaged $15.20 per cwt, an increase of $1.90 from last year. Marketings totaled 294 million pounds, down 3 percent from a year ago. A total of 13 million pounds of milk were used on farms and ranches where produced, 8 million pounds were fed to calves, and 5 million were consumed as milk, cream, and butter.

Nationally, milk production decreased 1 percent in 1996 to 154 billion pounds. The rate per cow at 16,505 pounds, was 72 pounds above 1995. The annual average number of cows on farms and ranches at 9.35 million head, was 107,000 less than 1995.

Cash receipts from marketings of milk during 1996 at $22.8 billion dollars, was 15 percent above 1995. Producer returns averaged $14.94 per cwt, $2.01 per cwt above 1995. Marketings totaled 153 billion pounds, 1 percent below 1995. Marketings include whole milk sold to plants and dealers as well as milk sold directly to consumers.

An estimated 1.49 billion pounds of milk were used on farms and ranches where produced, 6 percent less than 1995. Calves were fed 80 percent of this milk with the remainder consumed in producer households.

U.S. APRIL MILK PRODUCTION UP 0.8 PERCENT

Milk production in the 20 major States during April totaled 11.4 billion pounds, up 0.8 percent from production in these same States in April 1996. March revised production, at 11.6 billion pounds was up 1.1 percent from March 1996. Production per cow in the 20 major States averaged 1,469 pounds for April, 28 pounds above April 1995. The number of cows on farms in the 20 major States was 7.73 million head, 87,000 head less than April 1996 and 5,000 head less than March 1997.

MONTANA AND U.S. RED MEAT PRODUCTION DOWN FOR APRIL

Montana slaughter plants produced 1.1 million pounds, dressed weight, of red meat during April 1997, down 15 percent from April 1996. Cattle slaughter totaled 1,300 head, 200 head less than a year ago. The average live weight, at 1,144, was down 20 pounds from a year ago.

During April, there were 1,500 head of hogs slaughtered, 400 less than last year. The average live weight decreased 13 pounds to 221 pounds. Sheep slaughter was the same as a year earlier at 100 head, however, the average live weight increased 15 pounds to 126 pounds.

Commercial red meat production for the United States totaled 3.59 billion pounds during April, down 3 percent from the previous year. Beef production, at 2.10 billion pounds, was down 3 percent from a year ago. Cattle slaughter totaled 3.06 million head, down 2 percent from a year earlier. The average live weight was down 8 pounds from the previous year, at 1,152 pounds.

Veal production totaled 28.0 million pounds, down 3 percent from a year earlier. Calf slaughter totaled 129,100 head, 2 percent below a year earlier. The average live weight was down 6 pounds to 351 pounds.

Pork production, at 1.45 billion pounds, was down 3 percent from the previous year. Hog kill totaled 7.73 million head, 4 percent below a year earlier. The average live weight was up 2 pounds from last year at 256 pounds. Lamb and mutton production totaled 22.0 million pounds, down 15 percent from the previous record low set in 1996. Sheep slaughter totaled 331,300 head, down 16 percent from a year ago. The average live weight was up 2 pounds to 133 pounds.

ALL HIRED WORKERS UP 3 PERCENT, WAGES UP 5 PERCENT FROM LAST APRIL

There were 1.02 million hired workers on the Nation's farms and ranches during the week of April 6-12, 1997, 3 percent more than last year. Of those workers, 809,000 workers were hired directly by farm operators. Agricultural service employees on farms and ranches made up the remaining 207,000 workers. Migrant workers accounted for 6.3 percent of the hired workforce, compared to 7.5 percent a year ago.

Farm operators paid their hired workers an average wage of $7.10 per hour during the April 1997 survey week, up 34 cents from a year earlier. Field workers received an average of $6.72 per hour, up 41 cents. Livestock workers earned $6.41 per hour compared with $6.22 a year earlier.

THE AGRICULTURAL SURVEY IS NOW UNDERWAY.

You may be part of a sample of Montana producers that will be asked by interviewers to participate in the survey between May 29 and June 16. **Please say yes!** This survey is particularly vital because it will provide the first clear indications of the potential production of major commodities in 1997.

The information gathered is widely used. Producers rely on the data to reach valid production, marketing, and investment decisions. Industry analysts, extension agents, and farm organizations use the information in a variety of ways that benefit farmers.

We safeguard the confidentiality of all survey responses. Information from individual operations is combined with other responses to provide the needed data. Montana Agriculture Statistics Service works with all farmers and ranchers to provide meaningful, accurate, and objective statistics that help keep Montana's and the Nation's agriculture informed.

APRIL EGG PRODUCTION UP 1 PERCENT

U.S. egg production totaled 6.34 billion during April 1997, up 1 percent from the 6.24 billion produced in 1996. Production included 5.34 billion table eggs and 998 million hatching eggs, of which 939 million were broiler-type and 59.0 million were egg-type. The total number of layers during April 1997 averaged 303 million, up 2 percent from the average number of layers during April 1996. April egg production per 100 layers was 2,093 eggs, compared with 2,105 in April 1996.

All layers in the U.S. on May 1, 1997, totaled 302 million, up 2 percent from a year ago. The 302 million layers consisted of 247 million layers producing table or commercial type eggs, 53.0 million layers producing broiler-type hatching eggs, and 2.69 million layers producing egg-type hatching eggs. Rate of lay per day on May 1, 1997, averaged 69.1 eggs per 100 layers, down fractionally from the 69.4 a year ago.

Laying flocks in the 30 major egg production States produced 6.01 billion eggs during April, up 2 percent from April 1996. The average number of layers during April, at 287 million, was up 2 percent from the year earlier.

MONTANA POTATO STOCKS DOWN 35 PERCENT, U.S. POTATO STOCKS UP 32 PERCENT

Montana potato producers held stocks of 220 thousand cwt. on May 1, down from 340 thousand cwt. last year. Potatoes in storage amounted to 7 percent of the 1996 production, compared with 12 percent the previous year.

Nationally, May 1, 1997 stocks totaled 101 million cwt, up 32 percent from last year and 15 percent above two years ago. Stocks made up 23 percent of fall potato production in the 15 storage States, up 4 points from a year ago. Season-to-date disappearance totaled a record high 340 million cwt, up 7 percent from last year and 6 percent above two years ago. Processor usage was also record high at 166 million cwt, up 7 percent from last year. Shrinkage and loss to date was 32.8 million cwt, 9 percent above a year ago and 7 percent above losses two years ago.

Processors continued to move potatoes at a record pace for the season. April processor usage was 18.2 million cwt, up 8 percent from a year ago but 1 percent below two years ago.

Western States potato stocks totaled 76.6 million cwt in six States, up 26 percent from last year and 7 percent above two years ago. Idaho's stocks were up 6 percent. Washington's stocks gained 32 percent, and Oregon's stocks were more than double last year's level. These three States held 65 percent of U.S. stocks. Colorado's stocks were up 58 percent. California's stocks equaled a year ago.

1996 MONTANA FARM AND RECREATIONAL BUSINESS SURVEY

During the later half of 1996, Montana Agricultural Statistics Service conducted a recreational business survey of farms and ranches across Montana. The survey focused on finding out how many farms and ranches are currently involved in some form of recreational business. Reports were summarized for more than 7,500 respondents from nearly 16,000 farms and ranches sampled. There currently are 22,000 farms and ranches in Montana.

When asked, "Do you or a family member operate any form of recreational business on your property?" five percent of all respondents said yes. Approximately 1,100 farms and ranches have recreational businesses. Farms and ranches with more than 3,000 acres in their operation had the highest percentage of respondents saying yes with 9 percent saying they operate some form of recreational business.

Fee hunting/fishing was the most popular form of a recreational business reported and guiding/outfitting was the second most reported business. Other reported businesses included dude/guest ranch, working farm/ranch, bed and breakfast, cattle/wagon drives, and tours.

Of the farms and ranches that did not currently operate a recreational business, 7 percent, or about 1,500, responded they anticipated operating a recreational business on their property in the next five years. Again, the largest farms, or those with over 3,000 acres, had the highest rate with 7 percent saying they will operate some form of business in the next five years. The types of businesses the farms and ranches would operate were ranked nearly the same as those places currently operating a recreational business.

The survey was conducted with funds provided by Travel Montana.

U.S. CATTLE ON FEED UP 8 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 9.93 million head on May 1, 1997.

The inventory was 8 percent above May 1, 1996. Placements in feedlots during April totaled 1.54 million, 13 percent above 1996. Net placements were 1.44 million. During April, placements of cattle and calves weighing less than 600 pounds were 302,000, 600-699 pounds were 314,000, 700-799 pounds were 528,000, and 800 pounds and greater were 394,000.

Marketings of fed cattle during April totaled 1.91 million, slightly above 1996. Other disappearance totaled 98,000 during April, 8 percent below the previous year.

featuring...ROOSEVELT COUNTY

Located in northeastern Montana, Roosevelt County has the lowest altitude in the state. The approximate land area of the county is 1,508,000 acres. According to the 1992 U.S. Census of Agriculture, 1,271,000 of those acres are in farmland. The Montana/North Dakota border marks the eastern boundary of Roosevelt County, while the Missouri River marks the entire southern boundary. The Poplar River traverses the county from north to south, emptying into the Missouri River at the southern border. The Fort Peck Indian Reservation occupies all but the eastern section of the county. The terrain is mainly rolling prairie.

Roosevelt County is a prominent agricultural area in the state. The cropland is largely non-irrigated and a variety of crops are raised there. In the 1995 crop production figures, the county ranked 3rd in durum wheat and oats production, and came in 6th among the other spring wheat producing counties. Barley ranked 24th, winter wheat ranked 43rd, and all hay holds 34th place in the rank among the counties. Sugar beets and corn are also grown.

Although crops are the main source of agricultural income, livestock are also an important part of the county's economy. Roosevelt County came in 24th in hog production in the December 1, 1995 inventory. In the January 1, 1996 breeding sheep and lamb and all cattle and calf counts, Roosevelt County came in 24th and 40th place, respectively.

Cash receipts for crops in 1994 were $37,730,000. The sale of livestock and livestock product contributed $8,447,000 and government payments added $9,620,000--making a total of $55,797,000 in all cash receipts for Roosevelt County in 1994.

MAY 1, 1997 WINTER WHEAT PRODUCTION FORECAST

Montana growers expect to produce 57.75 million bushels of winter wheat this year. If the current expectations hold, the 1997 crop would be 9% less than last year. Average yields are estimated at 35 bushels per acre, up 3 bushels from last year's final yield. Producers intend to harvest 1.65 million acres, down 17% from last year.

Dry conditions last fall held back many producers from planting winter wheat. If producers' harvesting expectations are realized this would be the fifth smallest harvested acreage in the last 40 years. The winter was generally favorable for the crop with good snow cover reducing the amount of wind damage occurring. This spring started off very cool and held back plant development, but most of the state, so far, has adequate moisture supplies which should help the crop get started. As of May 5 the condition of the crop was rated 2% very poor, 6% poor, 29% fair, 55% good, and 8% excellent.

U.S. winter wheat production is forecast at 1.56 billion bushels, up 6% from 1996 and 1% more than in 1995. Based on May 1 conditions, the U.S. yield is forecast at 38.2 bushels per acre. If realized, this would be a full bushel better than last year and a half-bushel above 1995. Grain area totals 40.8 million acres, up 3% from last year. Hard Red Winter wheat production is forecast up 17% from last year while Soft Red and White Winter wheat are down 3 and 12%, respectively.

A hard freeze hit portions of Texas, Oklahoma, Kansas, and Colorado April 11-13. Considerable damage was evident, but assessment of crop loss is continuing. This same area also suffered a mid-April freeze in 1995. The Hard Red Winter (HRW) wheat area for grain is expected to be up 9% from last year. Soft Red Winter (SRW) wheat is estimated to be down 10% from last year and White Winter wheat area is about 6% less than a year ago. Prior to the freeze, expectations for the central and southern Plains HRW crop were well above average. Condition ratings fell the week following the freeze, but have started to improve. Nebraska's major growing area had minimal winterkill, but needs moisture. Severe winterkill has been reported in areas of southern South Dakota.

MAY 1 HAY STOCKS

Montana May 1 hay stocks on farms were estimated at 492,000 tons, 57% of stocks held May 1, 1996 and the smallest tonnage on hand since May 1989. May 1 stocks were just 10% of 1996 production compared with 16% of production held a year earlier. Disappearance of hay from December 1, 1996 - May 1, 1997, totaled 4,182,000 tons, 3% more than the 1995 crop disappearance of 4,073,000 tons for the same period. The low stocks held are the result of high feed requirements during the winter. Livestock required supplemental feeding very early in the season because of heavy snows and the situation remained unchanged nearly all season. A heavy snow in eastern Montana in early April further reduced already short supplies.

Stocks of all hay on **U.S.** farms totaled 17.4 million tons on May 1, 1997, down 16% from May 1 of the previous year. A 3% decline in 1996 hay production, combined with one of the harshest winters on record in the upper mid-west, contributed to the lowest May 1 stocks in 32 years. Disappearance of hay from December 1, 1996 - May 1, 1997, totaled 87.8 million tons, 1% lower than the 1995 crop disappearance of 88.7 million tons for the same period. Stocks of hay on May 1, 1997 were lower compared to last year in 27 of the 48 estimating States. Heavy snow and bitterly cold temperatures during the winter and spring months across the northern half of the United States forced livestock producers to increase feeding of hay. December 1996 - May 1997 hay disappearance of 4.1 million tons was the highest on record in North Dakota and May 1 hay stocks in Colorado were the lowest since 1940. Stocks were higher in the Southeast and Central Plains and in many States in the Northeast. An increase in hay production, a mild winter, and reduced cattle numbers were the main reasons given for those increases in stocks.

1996 DAIRY PRODUCTION

Montana dairy plants produced 178,000 gallons of lowfat, hard ice cream during 1996, the same as 1995 production. Lowfat, soft ice cream production totaled 1.3 million gallons, up 16 percent from last year. Lowfat ice cream mix production totaled 772,000 gallons, 10 percent more than last year.

Nationally, total cheese production, excluding cottage cheeses, was 7.22 billion pounds, 4 percent above the 1995 production. Wisconsin was the leading State with 29 percent of the production. American type cheese production, at 3.28 billion pounds, was 5 percent above 1995 and accounted for 45 percent of total cheese in 1996.

Italian varieties, with 2.81 billion pounds produced, were 5 percent above the 1995 production. Mozzarella accounted for 80 percent of the Italian production followed by Ricotta with 9 percent and Provolone with 7 percent. Wisconsin was the leading State in Italian cheese production with 30 percent of the total.

Production of butter in the United States during 1996 totaled 1.17 billion pounds, 7 percent less than 1995. Ice cream production increased in 1996. Regular ice cream production totaled 879 million gallons, up 2 percent from 1995. Lowfat ice cream, at 366 million gallons, was up 3 percent.

Nonfat dry milk for human food production, at 1.06 billion pounds, was down 14 percent from 1995. Dry whole milk, at 134 million pounds, was down 22 percent.

POULTRY PRODUCTION AND VALUE

Montana's 1996 value of egg sales of $5.9 million was ninetee the percent higher than last year due to increased production and average price. Egg production increased 3 percent. The average price was 66 cents, up 9 cents per dozen.

Montana's value of sales from chickens, excluding broilers, was $32,000. Chickens sold for an average price of 2 cents per pound, down from 3 cents last year, and the number of pounds sold decreased 25 percent.

The Nation's combined value of production from broilers, eggs, and turkeys and the value of sales from chickens in 1996, was $21.8 billion, up 18 percent from the $18.5 billion in 1995. Of the combined total, 64 percent was from broilers, 22 percent from eggs, 14 percent from turkeys, and less than 1 percent from other chickens.

The value of broilers produced during 1996 was $13.9 billion, up 18 percent from the $11.8 billion in 1995. The total number of broilers produced in 1996 was 7.60 billion, up 4 percent from 1995. The 1996 average price per pound on a live weight equivalent basis was 38.1 cents per pound, compared to 34.4 cents per pound in 1995.

The value of turkeys produced during 1996 was $3.10 billion, up 12 percent from the $2.78 billion the previous year. Turkey production in 1996 totaled 7.17 billion pounds live weight, compared with 6.78 billion pounds in 1995. The average price received by producers during 1996 was 43.3 cents per pound, compared with 41.0 cents in 1995.

See table on back page.

AGRICULTURAL PRICES RECEIVED FOR MARCH

Montana crop prices for the full month of March were lower with the exception of oats and barley. Winter wheat dropped 6 cents to $4.01 per bushel, durum wheat declined 13 cents to $4.28 per bushel. Spring wheat went down 2 cents to $4.03 per bushel. Feed barley increased 8 cents per bushel to $2.42 but malt barley declined 34 cents to $3.16 per bushel. At $2.05 per bushel oats averaged 13 cents higher than the previous month. The all wheat price for mid-April averaged $4.26 per bushel and the all barley price was $2.54. Prices for alfalfa hay in April, at $114.00 per ton is the same as March. The April other hay price increased $2.00 since March to $95.00 per ton.

Livestock prices for the full month of March were mostly higher than the previous month with the exception of lambs. Steers and heifers saw a $2.20 increase to $72.50 per cwt. Cows increased $2.30 to $40.30 and the average price for calves rose $3.10 to $80.40 per cwt. Sheep increased 70 cents to $42.50 per cwt while lambs declined $6.10 to $98.90 per cwt. Milk prices increased 40 cents to $13.40 per cwt. Steer and heifer prices for mid-April averaged $72.50 per cwt.

Nationally, steer and heifer prices averaged $67.90 per cwt for the full month of March. Cow prices came in at $36.90 and hogs were $49.40 per cwt. The U.S. all wheat price was $3.93 per bushel and $2.36 per bushel for all barley. Egg prices were 71.8 cents per dozen.

The All Farm Products Index of Prices Received in April was 106 based on 1990-92=100, down 1 point (0.9 percent) from March. Price decreases from March for tomatoes, strawberries, eggs, and broilers were offset by price increases for hogs, onions, wheat, and lettuce. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower seasonal marketings of soybeans, corn, cotton, and wheat more than offset the relatively higher marketings of cattle, milk, oranges, and strawberries. These changes contributed virtually all of the one point decrease in the overall index.

Compared with April 1996, the All Farm Products Index was 2 points (1.9 percent) lower. Price decreases from April 1996 for corn, eggs, wheat, and potatoes more than offset price increases for cattle, hay, hogs, and calves.

UNITED STATES INDEX SUMMARY

1996 MEAT ANIMAL PRODUCTION, DISPOSITION AND INCOME

Cash receipts from 1996 marketings of cattle, sheep, and hogs in Montana totaled $722 million, down one percent from 1995. Cattle and calf cash receipts of $656 million dropped 2 percent from the previous year. Cattle marketings totaled 1.4 million head, up 10 percent, while calf marketings were down 9 percent to 205,000 head. The average price received for cattle fell $6.00 to $53.80 per cwt, likewise, calf prices averaged $62.20 per cwt, $7.30 lower than last year.

Montana hog and pig cash receipts increased 10 percent from 1995 to $37 million. Hog marketings, at 342,000 head, decreased 6 percent from last year. Hog prices for 1996 were $10.60 higher at $49.70 per cwt. Sheep and lamb cash receipts came in at $29 million, a 12 percent increase from 1995. Marketings for sheep and lambs in 1996 were 76,000 and 303,000 head, respectively. The average price for sheep rose $4.40 per cwt to $31.20. The average lamb price of $91.10 was $9.70 higher than the previous year.

The U.S. gross income from cattle and calves, hogs and pigs, and sheep and lambs in 1996 totaled $44.7 billion, down 1 percent from 1995. Gross income rose for hogs and pigs and sheep and lambs, but fell for cattle and calves. Gross income from cattle and calves declined 8 percent, rose 23 percent for hogs and pigs, and increased 7 percent for sheep and lambs.

Total U.S. 1996 cash receipts from marketings of meat animals fell 1 percent to $44.4 billion. Cattle and calves accounted for 70 percent of this total, hogs and pigs 29 percent, and sheep and lambs 1 percent. Average prices rose from 1995 levels for hogs, sheep and lambs, while prices for cattle and calves dropped.

Cash receipts from marketings of cattle and calves in the U.S. decreased from $34.0 billion in 1995 to $31.1 in 1996, an 8 percent decline. All cattle and calf marketings totaled 56.2 billion pounds in 1996, virtually unchanged from last year. The U.S. annual average price per 100 pounds live weight for cattle was $58.70, a decline of $3.10 from the $61.80 in 1995. For calves, the annual average price fell $14.70 to $58.40.

Cash receipts from hogs and pigs totaled $12.6 billion during 1996, up 23 percent from 1995. Marketings decreased to 24.1 billion pounds in 1996, 4 percent below the previous year. The U.S. annual average price per 100 pounds live weight rose from $40.50 in 1995 to $51.90 in 1996.

Cash receipts from marketings of sheep and lambs in 1996 were $601 million, up 7 percent from 1995. Marketings declined 4 percent to 769 million pounds. The U.S. annual average price per 100 pounds live weight for lambs increased from $78.20 in 1995 to $88.20 in 1996 while for sheep, the annual average price increased $1.90 to $29.90.

APRIL 1 U.S. SHEEP AND LAMB INVENTORY

All sheep and lamb inventory in the United States on April 1, 1997, totaled 8.72 million head, 7 percent below April 1, 1996. Total breeding sheep and lambs reached 5.67 million head, 5 percent below April 1996. Market lambs (including newborn lambs), at 3.05 million head were 9 percent below April 1996.

Of the April 1, 1997 breeding herd, 4.71 million head were ewes one year old and older compared with 4.96 million head in April 1996. A total of 740,000 lambs will be used as replacements compared with 785,000 head on April 1, 1996.

Of the total market lambs (including new born lambs), 63.8 percent were under 65 pounds, 9.8 percent were 65 to 84 pounds, 10.6 percent were 85 to 105 pounds, and the remainder, 15.8 percent, were over 105 pounds on April 1.

U.S. CATTLE ON FEED UP 6 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.39 million head on April 1, 1997. The inventory was 6 percent above April 1, 1996. The inventory included 6.39 million steers and steer calves, up 1 percent from the previous year. This group accounts for 61 percent of the total inventory. Heifers and heifer calves accounted for 3.94 million head, up 15 percent from 1996.

Placements in feedlots during March totaled 1.97 million, 1 percent above 1996. Net placements were 1.88 million. During March, placements of cattle and calves weighing less than 600 pounds were 321,000, 600-699 pounds were 538,000, 700-799 pounds were 721,000, and 800 pounds and greater were 386,000.

Marketings of fed cattle during March totaled 1.76 million, slightly above 1996. The year-to-year relationship between fed cattle marketed and commercial slaughter continues to be affected by the decrease in cattle imported from Canada that are going directly to slaughter. Other disappearance totaled 86,000 during March, 13 percent above the previous year.

MONTANA AND U.S. RED MEAT PRODUCTION DOWN IN MARCH

Montana slaughter plants produced 1.1 million pounds, dressed weight, of red meat during March, the same as March 1996, but 8 percent less than last month. There were 1,200 head of cattle slaughtered, unchanged from a year ago. The average live weight of cattle slaughtered decreased 27 pounds to 1,143 pounds.

Hog kill in March totaled 1,700 head, the same as March 1996. The average live weight decreased 14 pounds to 220 pounds. There were 100 head of sheep slaughtered in March, the same as a year ago at this time. The average live weight of sheep slaughtered increased 6 pounds to 124 pounds.

Commercial red meat production for the United States totaled 3.44 billion pounds during March, down 2 percent from the previous year.

Beef production, at 1.97 billion pounds, was down 3 percent from the previous year. Cattle slaughter totaled 2.86 million head, down 1 percent from a year earlier. The average live weight was down 13 pounds from the previous year, at 1,161 pounds. Veal production totaled 28.0 million pounds, down 8 percent from a year earlier. Calf slaughter totaled 130,800 head, 10 percent below a year ago. The average live weight was up 5 pounds to 348 pounds.

Pork production, at 1.42 billion pounds, was unchanged from the previous year. Hog kill totaled 7.58 million head, 2 percent below a year earlier. The average live weight was up 3 pounds from the previous year at 256 pounds. Lamb and mutton production totaled 26.0 million pounds, down 4 percent from the previous record low set in 1979, 1987, and 1996. Sheep slaughter totaled 398,100 head, down 4 percent from a year ago. The average live weight was down 1 pound to 133 pounds.

January - March red meat production was 10.5 billion pounds, down 4 percent from the comparable figure last year. Accumulated beef production was down 3 percent, veal was down 6 percent, pork was down 4 percent, and lamb and mutton was down 9 percent.

MONTANA QUARTERLY MILK PRODUCTION DOWN, WHILE U.S. MARCH PRODUCTION UP SLIGHTLY

During the January-March quarter, Montana milk cows produced 74 million pounds of milk, down 1 million from the same quarter a year ago. Montana milk cow numbers dropped 1,000 head from last year to 19,000 head.

Grain and other concentrates fed to Montana's milk cows on April 1 averaged 16.5 pounds per day, down 0.6 lbs. from a year earlier. The value of grain and other concentrates fed to cows on April 1 averaged $7.90 per cwt, down 90 cents from April 1, 1996.

Milk production in the 20 major States during March totaled 11.5 billion pounds, up 0.3 percent from production in these same States in March 1996. February revised production, at 10.3 billion pounds was down 2.3 percent from February 1996.

Production per cow in the 20 major States averaged 1,491 pounds for March, 22 pounds above March 1996. The number of cows on farms in the 20 major States was 7.73 million head, 90,000 head less than March 1996 and 11,000 head less than February 1997.

The January-March quarterly production of milk for the U.S. was 38.8 billion pounds, down 0.6 percent from the January-March period in 1996. The average number of milk cows in the U.S. during the January-March quarter was 9.26 million head, 133,000 head less than the same period a year earlier.

Grain and other concentrates fed to milk cows on April 1, 1997, averaged 19.5 pounds per cow, 0.9 pound more than April 1, 1996. The value of grain and other concentrates fed to milk cows on April 1, 1997, averaged $8.79 per hundredweight, 36 cents less than April 1, 1996.

MONTANA POTATO STOCKS UP 9 PERCENT, U.S. POTATO STOCKS UP 23 PERCENT

Montana producers held 1.9 million cwt. of potatoes in storage on April 1, up 9 percent from last year. Potatoes in storage account for 59 percent of 1996 production, compared with 60 percent the previous year.

U.S. April 1, 1997 stocks totaled 143 million cwt, up 23 percent from last year and 11 percent above two years ago. Stocks made up 32 percent of fall potato production in the 15 storage States, up two points from a year ago. Season-to-date disappearance totaled a record 298 million cwt, up 7 percent from the last two years. Processor usage was also record high at 148 million cwt, up 7 percent from last year. Shrinkage and loss to date was 29.3 million cwt, 5 percent above a year ago.

Stocks in the six Western States totaled 105 million cwt, up 20 percent from last year and 4 percent above two years ago. Idaho's stocks were up 5 percent. Washington's stocks gained 28 percent, and Oregon's stocks increased 87 percent. These three States contain 62 percent of U. S. stocks. Colorado's stocks were up 41 percent, while California's equaled a year ago.

U.S. EGG PRODUCTION UP TWO PERCENT

U.S. egg production totaled 6.60 billion during March 1997, up 2 percent from the 6.50 billion produced in 1996. Production included 5.58 billion table eggs and 1.02 billion hatching eggs, of which 957 million were broiler-type and 63.0 million were egg-type. The total number of layers during March 1997 averaged 303 million, up 2 percent from the average number of layers during March 1996. March egg production per 100 layers was 2,177 eggs, compared with 2,178 in March 1996.

All layers in the U.S. on April 1, 1997, totaled 303 million, up 2 percent from a year ago. The 303 million layers consisted of 248 million layers producing table or commercial type eggs, 52.1 million layers producing broiler-type hatching eggs, and 2.63 million layers producing egg-type hatching eggs. Rate of lay per day on April 1, 1997, averaged 70.4 eggs per 100 layers, down 1 percent from the 70.9 a year ago.

Laying flocks in the 30 major egg production States produced 6.25 billion eggs during March, up 2 percent from March 1996. The average number of layers during March, at 287 million, was up 2 percent from the year earlier.

MARCH 1997 PROSPECTIVE PLANTINGS

Montana's wheat farmers intend to plant 6.07 million acres of wheat this year, down over 8 percent from last year. Last fall's dry conditions caused a large decrease in the amount of winter wheat seeded which will lead to another large spring wheat seeding. Winter wheat seedings are estimated at 1.75 million acres, down 400,000 acres from the previous year. Farmers intend to plant 4.0 million acres of spring wheat, down 5 percent from 1996's record--making it the second largest other spring wheat acreage on record. Farmers plan on seeding 320,000 acres of durum wheat, up 40,000 acres from last year.

Barley acreage intentions are up 4 percent from last year and set at 1.35 million acres. Farmers intend to plant 140,000 acres of oats, up 40,000 acres from last year, and to harvest 60,000 acres for grain.

Corn producers intend to plant an estimated 53,000 acres of corn which, if realized, would be a record low for the state and down 2,000 acres from last year's plantings. Dry bean acreage is estimated at 10,000 acres, down from the 10,500 acres planted last year. Sugar beet acreage intentions are estimated at 60,300 acres, up 2,600 acres from a year ago. Hay producers intend to harvest 2.7 million acres of hay, up 100,000 acres from 1996, and a record high for the state.

U.S. corn growers intend to plant 81.4 million acres of corn for all purposes in 1997, up 2 percent from last year and 14 percent above 1995. If these intentions materialize, this would be the largest planted acreage since 1985. Expected acreage is up in most Corn Belt States with the exception of Iowa, Michigan, and Minnesota.

Soybean growers intend to plant 68.8 million acres for 1997, up 7 percent from 1996 and 10 percent above 1995. If realized, this acreage would be the highest since 1980. All but 3 of the 29 soybean growing States anticipate an increase in soybean acres from last year.

All wheat planted acres for 1997 are expected to total 69.2 million acres, down 9 percent from last year, but up slightly from 1995 plantings. Durum wheat growers intend to plant 3.19 million acres for 1997, down 12 percent from 1996. North Dakota, the major durum wheat State, intends to plant 13 percent less acres. Other spring wheat plantings are expected to total 17.8 million acres for 1997, down 11 percent from 1996, but up 4 percent from 1995. Only Oregon, Utah, Washington, and Wyoming intend to plant larger acreages than last year.

PLANTED ACREAGE, 1995-1996, and INTENDED 1997, MONTANA and UNITED STATES

MONTANA AGRICULTURAL PRICES RECEIVED FOR FEBRUARY MOSTLY HIGHER

Montana crop prices for the full month of February were higher with the exception of winter and spring wheat. Winter wheat dropped 7 cents to $4.07 per bushel, while durum wheat jumped 22 cents to $4.41 per bushel. Spring wheat went down 10 cents to $4.05 per bushel. Feed barley increased a penny to $2.34 and malt barley rose 13 cents to $3.50 per bushel. At $1.92 per bushel oats averaged 40 cents higher than the previous month. Alfalfa hay climbed $11.00 to $117.00 a ton and other hay increased $5.00 to $93.00 per ton. The all wheat price for mid-March averaged $4.08 per bushel and the all barley price was $2.97. Mid-March prices for alfalfa hay decreased to $114.00 a ton and other hay remained the same.

Livestock prices for the full month of February were higher than the previous month, with the exception of sheep and milk. Steers and heifers saw a $2.80 increase to $70.30 per cwt. Cows jumped $4.70 to $38.00 while the average price for calves rose $7.20 to $77.30 per cwt. Sheep remained unchanged at $41.80 per cwt and lambs went up a dollar to $105.00 per cwt. Milk prices dropped 50 cents to $13.00 per cwt. Steer and heifer prices for mid-March averaged $72.80 per cwt.

Nationally, steer and heifer prices averaged $65.20 per cwt for the full month of February. Cow prices came in at $33.30 and hogs were $52.80 per cwt. The U.S. all wheat price was $3.88 per bushel and $2.44 per bushel for all barley. Egg prices were 75.7 cents per dozen.

The U.S. All Farm Products Index of Prices Received in March was 108 based on 1990-92=100, up 3 points (2.9 percent) from February. Price increases from February for cattle, soybeans, corn, and tomatoes more than offset price decreases for eggs, hogs, broilers, and grapefruit. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Higher seasonal marketings of milk, tomatoes, soybeans, and strawberries more than offset the relatively lower marketings of cattle, corn, cotton, and oranges. These changes contributed one point of the three point increase in the overall index.

Compared with March 1996, the All Farm Products Index was 1 point (0.9 percent) lower. Price decreases from March 1996 for wheat, corn, eggs, and potatoes more than offset price increases for cattle, hay, soybeans, and broilers.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Feb. 1996	Mar. 1996	Feb 1997	Mar. 1997

U.S. HOG INVENTORY DOWN 1 PERCENT

U.S. inventory of all hogs and pigs on March 1, 1997, was 55.9 million head, 1 percent below March 1996 and slightly below the December 1, 1996, inventory.

Breeding inventory, at 6.80 million head is up 1 percent from March 1, 1996 and up 2 percent from December 1, 1996. Market hog inventory, at 49.1 million head was 1 percent below both last year and last quarter.

The December 1996-February 1997 U.S. pig crop at 23.1 million head was slightly more than 1996 but 3 percent less than 1995. Sows farrowing during this period totaled 2.68 million head, 2 percent below last year. Litter rate increases continue at a record level, with an average of 8.62 pigs saved per litter for the December-February period. Last year the litter rate averaged 8.40 pigs per litter. Pigs saved per litter by size of operation ranged from 7.20 for operations with 1-99 hogs to 8.90 for operations with more than 2,000 hogs and pigs.

U.S. hog producers intend to have 2.96 million sows farrow during the March-May 1997 quarter, slightly below the actual farrowings during the same period last year, and 7 percent lower than 1995. Intended farrowings for June-August 1997, at 2.82 million sows are 2 percent above 1996 but 5 percent below the 1995 period.

The total number of hogs under contract, owned by operations with over 5,000 head total inventory, but raised by contractees, accounted for 24 percent of the total U.S. hog inventory. This compares to 21 percent in December 1996.

The Montana crop acreage and grain stocks report estimates in this issue of the Reporter are the result of surveying approximately 1,500 Montana farmers and ranchers during March. Names were selected on a statistical probability basis. SPECIAL THANKS to those operators that were interviewed and responded to the survey. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics.

1996 MONTANA RED MEAT PRODUCTION UP 2 PERCENT

Montana slaughter plants produced 18.1 million pounds, dressed weight, of red meat during 1996, compared with 17.8 million pounds in 1995. There were 20,700 cattle slaughtered during 1996, up 5 percent from the previous year. The total live weight of 24.1 million pounds was up 5 percent from a year earlier. The average live weight was down 35 pounds to 1,165 pounds.

There were 22,500 hogs slaughtered in Montana, a decrease of 6,300 head from 1995. Total live weight of 5.1 million pounds was down 26 percent from 1995, and the average live weight per head was 227 pounds compared with 239 pounds the previous year. Sheep slaughter amounted to 2,900 head, a decrease of 300 head from a year earlier. The average live weight was equal to the previous year at 115 pounds. Total live weight of all sheep and lambs slaughtered in 1996 decreased 38,000 pounds from 1995 to 332,000 pounds.

The number of Montana slaughter plants federally inspected on January 1, 1997 was 15, down 1 from 1996. There were 36 non-federally inspected plants on January 1, 1997, down 2 from the same date a year ago.

Red meat production in commercial plants and on farms for the **United States** during 1996 totaled 43.3 billion pounds, down 1 percent from the record high set in 1995. Production included beef, veal, pork, and lamb and mutton slaughtered in commercial plants and on farms. Red meat production in commercial plants totaled 43.1 billion pounds. Lamb and mutton production was down 7 percent from 1995, setting a new record low. Beef production was up 1 percent from the previous year at 25.5 billion pounds, the highest level since 1976. Veal production, at 379 million pounds, was up 19 percent from the previous year, pork production at 17.1 billion pounds, was down 4 percent, while lamb and mutton production was down 7 percent to 269 million pounds.

Commercial cattle slaughter during 1996 totaled 36.6 million head, up 3 percent from 1995, with federal inspection comprising 97.6 percent of the total. The average live weight was 1,169 pounds, down 14 pounds from last year. Steers comprised 48.7 percent of the total federally inspected slaughter, heifers 29.4 percent, dairy cows 8.5 percent, beef cows 11.4 percent, and bulls 2.0 percent.

Commercial **calf** slaughter, at 1.77 million head, was up 24 percent from the previous year with 96.9 percent under federal inspection. The average live weight was 343 pounds, down 29 pounds from a year earlier. Commercial **hog** slaughter totaled 92.4 million head, down 4 percent from the previous year. Federal inspection comprised 98.0 percent. The average live weight fell 2 pounds to 254 pounds. Barrows and gilts were 95.5 percent of the total. Commercial **sheep and lamb** slaughter, at 4.18 million head, was down 8 percent from 1995 with federal inspection comprising 96.4 percent. Sheep and lambs average live weight was 128 pounds, up 3 pounds from 1995.

There were 954 slaughtering plants under federal inspection compared with 988 last year. Of these, 812 slaughtered at least one head of cattle and 13 plants slaughtered over 45 percent of the total head. There were 770 plants that slaughtered hogs, with 10 accounting for over 40 percent of the total. Likewise, 12 of the 380 plants that slaughtered calves comprised over half of the total and 3 of the 593 plants slaughtering one or more head of sheep or lambs in 1996 slaughtered 60 percent of the total head.

FEBRUARY MONTANA & U.S. RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 1.2 million pounds, dressed weight, of red meat during February, down 29% from last year and down 14% from last month. There were 1,400 head of cattle slaughtered, down 600 head from a year ago. The total live weight of 1.6 million pounds decreased 33% from a year earlier, and the average live weight decreased 79 pounds to 1,115 pounds.

Hog kill in February totaled 1,500 head compared with 1,800 head last year. The average live weight decreased 12 pounds to 224 pounds. There were 100 head of sheep slaughtered in February, the same as a year ago. The average live weight rose 7 pounds to 120 pounds. Total live weight was 12,000 pounds, compared with 15,000 pounds a year ago.

Commercial red meat production for the United States totaled 3.28 billion pounds during February, down 7 percent from the previous year. Beef production, at 1.92 billion pounds, was down 6 percent from the previous year. Cattle slaughter totaled 2.80 million head, down 4 percent from a year earlier. The average live weight was down 14 pounds from the previous year, at 1,162 pounds. (continued on page 2)

MONTANA AND U.S. RED MEAT PRODUCTION DOWN (continued)

Veal production totaled 27.0 million pounds, down 11 percent from a year earlier. Calf slaughter totaled 125,700 head, 12 percent below a year earlier. The average live weight was up 4 pounds to 348 pounds. **Pork** production, at 1.31 billion pounds, was down 8 percent from the previous year. Hog kill totaled 6.97 million head, 9 percent below a year earlier. The average live weight was up 2 pounds from the previous year at 256 pounds. **Lamb and mutton** production totaled 21.0 million pounds, down 10 percent from a year earlier and equaling the record low for February set in 1979. Sheep slaughter totaled 327,400 head, down 10 percent from a year ago. The average live weight was up 3 pounds to 132 pounds.

January-February red meat production was 7.01 billion pounds, down 5 percent from the comparable period a year earlier. Accumulated beef production was down 3 percent, veal was down 5 percent, pork was down 7 percent, and lamb and mutton was down 12 percent.

1996 MONTANA AND U.S. WOOL PRODUCTION

Montana wool growers produced 4.2 million pounds of wool during 1996, down 6 percent from 1995. The 1996 average price per pound of wool decreased 29 cents to 94 cents per pound. The value of wool produced was $3.9 million, a 28 percent decrease from the previous year. The total head shorn decreased 7 percent to 434,000 head. The average fleece weight rose from 9.4 pounds in 1995 to 9.6 pounds in 1996.

Shorn wool production in the United States during 1996 was 56.7 million pounds, down 11 percent from 1995. Sheep and lambs shorn totaled 7.28 million head, a decrease of 11 percent from 1995. The average price paid for wool sold in 1996 was $0.70 per pound for a total value of $39.7 million, down 38 percent from $64.3 million in 1995. The average fleece weight of 7.8 pounds remained unchanged from 1995.

U.S. FEBRUARY MILK PRODUCTION DOWN 2 PERCENT

Milk production in the 20 major States during February totaled 10.4 billion pounds, 2 percent below production in these same States in February 1996. The monthly decrease is due to 1996 being a leap year with February 1996 having 29 days. On a daily basis, February 1997 production increased 2 percent versus February 1996. January revised production, at 11.2 billion pounds was 1 percent above January 1996.

Production per cow in the 20 major States averaged 1,337 pounds for February, 10 pounds below February 1996. Again, the leap year in 1996 caused the monthly rate decline. The number of cows on farms in the 20 major States was 7.75 million head, 81,000 head less than February 1996 and 10,000 head less than January 1996.

U.S. CATTLE ON FEED UP 6 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.28 million head on March 1, 1997. The inventory was 6 percent above March 1, 1996.

Placements in feedlots during February totaled 1.77 million, 3 percent above 1996. Net placements were 1.71 million. During February, placements of cattle and calves weighing less than 600 pounds were 352,000, 600-699 pounds were 500,000, 700-799 pounds were 606,000, and 800 pounds and greater were 314,000. Marketings of fed cattle during February totaled 1.78 million, 4 percent below 1996. Other disappearance totaled 61,000 during February, 15 percent below the previous year.

Cattle on Feed in Historic 7 States Up 8 Percent

Cattle on feed March 1, 1997, in the historic 7 States for feedlots with capacity of 1,000 or more head totaled 8.77 million, up 8 percent from the previous year and 7 percent above March 1, 1995. Placements in feedlots during February totaled 1.53 million, 6 percent above 1996 but slightly below 1995. Marketings during February totaled 1.53 million, 1 percent below 1996 but 11 percent above 1995. Other disappearance during February was 42,000 head, 19 percent below both 1996 and 1995.

MONTANA POTATO STOCKS UP 8 PERCENT, U.S. UP 19 PERCENT

Montana producers stored 2.7 million cwt. of potatoes on March 1, 1997, compared with 2.5 million cwt. a year ago. The March 1 stocks represent 84 percent of 1996 production, one point below the 1995 production held a year earlier.

U.S. March 1, 1997 potato stocks totaled 185 million cwt, up 19 percent from last year and 9 percent above two years ago. Stocks account for 42 percent of the 1996 fall potato production in the 15 storage States, up two points from a year ago.

Disappearance from harvest through February totaled a record high 257 million cwt, up 8 percent from last year and 7 percent above two years ago. February disappearance of 35.9 million was 8 percent above a year ago. This includes potatoes fed to livestock. Shrinkage and loss to date was 26.7 million cwt, up 4 percent from the 25.6 million cwt lost last year and 2 percent above 26.2 million cwt lost two years ago.

Processors used 129 million cwt to March 1, 1997, up 7 percent from a year ago and 12 percent above two years ago. February processing of 19.9 million cwt of potatoes gained 14 percent on a year ago and 15 percent on the 1994 crop.

Western States held 133 million cwt of potatoes in storage on March 1, 1997. This is up 17 percent from last year and 4 percent above two years ago. Idaho's stocks were up 6 percent and accounted for 50 percent of the Western total. Oregon's stocks were up 70 percent and Washington was 20 percent above a year earlier. Colorado's stocks were up 37 percent from last year. California's stocks were down 4 percent.

MONTANA 1996 SHEEP AND LAMB LOSSES

Montana sheep and lamb producers lost 83,000 animals to weather, predators, disease, and other causes during 1996, representing a total value of $5.4 million. The total number of sheep and lambs lost was down 10 percent from 1995, but the total value of inventory lost in 1996 rose 1 percent. High market prices this past year resulted in an increased value of sheep and lambs. The decline in sheep and lamb losses is partly due to the drop in total inventory which is down 5 percent from the previous year.

There were comments by producers saying that they are downsizing their flocks or getting out of the sheep business entirely due to predator problems and/or fluctuating prices in the market. Sheep and lamb deaths amounted to 9.4 percent of the January 1 inventory and lambs born--slightly lower than the previous year.

Predators caused an estimated $1.9 million in losses in 1996 down from $2.0 million the previous year. Losses due to predators amounted to 3.5 percent of the January 1 inventory and lambs born, slightly lower than the 10 year average of 3.6 percent. Predators accounted for 38 percent of all sheep and lamb deaths.

Coyotes remained the largest predator and the largest cause of all deaths. The value of losses attributed to coyotes was $1.4 million. The number of sheep and lambs lost to all predators totaled 31,200 head, down 5,900 head from last year. Coyotes accounted for 27 percent of all death losses in the state and 72 percent of all predator losses. Lamb losses by all predators amounted to 26,200 head, down 17 percent from last year. Most of the decrease in lamb losses was due to a decline in coyote losses. Lambs lost to coyotes dropped 4,500 head. The number of sheep lost to all predators totaled 5,000, down 700 head from a year ago. The largest cause of sheep losses by predators was coyotes at 3,500 head.

The total value of non-predatory losses was $2.6 million in 1996--lower than the $2.8 million the previous year. Non-predatory losses accounted for 47 percent of all losses. There were 27,400 head of lambs lost to weather, disease and other non-predatory causes in 1996, down 11 percent from a year ago. The largest non-predatory cause of lamb losses was weather conditions at 12,900 head.

Sheep losses to non-predatory factors totaled 11,800, 26 percent lower than 1995. Sheep lost to old age continued to be the largest cause at 4,500 head, down 1,200 head from the previous year.

A large number of producers reported sheep and lambs lost to unknown causes this past year, resulting in a 58 percent increase. Lambs lost to unknown causes were up 3,700 head to 8,400 head. Unknown causes claimed 4,200 sheep, 900 more head than last year. The value of sheep and lambs lost to unknown causes increased $.4 million to $.9 million.

FEBRUARY EGG PRODUCTION DOWN 1 PERCENT

U.S. egg production totaled 5.88 billion during February 1997, down 1 percent from the 5.95 billion produced in 1996. Production included 4.98 billion table eggs and 902 million hatching eggs, of which 848 million were broiler-type and 54.0 million were egg-type. The total number of layers during February 1997 averaged 303 million, up 2 percent from the average number of layers during February 1996. February egg production per 100 layers was 1,941 eggs, compared with 1,996 in February 1996.

All layers in the U.S. on March 1, 1997, totaled 304 million, up 2 percent from a year ago. The 304 million layers consisted of 250 million layers producing table or commercial type eggs, 51.5 million layers producing broiler-type hatching eggs, and 2.63 million layers producing egg-type hatching eggs. Rate of lay per day on March 1, 1997, averaged 69.8 eggs per 100 layers, up fractionally from the 69.5 a year ago.

Laying flocks in the 30 major egg production States produced 5.57 billion eggs during February, down 1 percent from February 1996. The average number of layers during February, at 287 million, was up 2 percent from the year earlier.

MONTANA WHEAT AND BARLEY MOVEMENT

The 56.2 million bushels of **wheat** shipped to out-of-state destinations during June-November 1996 were 42 percent below shipments for the same period last year.

Shipments to western destinations (primarily export facilities of Washington and Oregon) were 41 percent below the previous June-November period. Wheat movement to eastern destinations was down 59 percent. Shipments to other destinations were down 36 percent.

Rail movement of 52.7 million bushels was down from 91.7 million shipped by rail during the same period in 1995. Trucks carried 3.5 million bushels compared with 5.7 million the previous June-November period.

Barley shipped to out-of-state destinations in June-November 1996 was 13.2 million bushels, down 22 percent from the same period last year.

Barley shipped west amounted to 8.7 million bushels, down 29 percent from the 12.2 million bushels in the June-November 1995 period. Eastern shipments totaled 2.6 million bushels, down 33 percent from the 3.9 million bushels the previous year.

Movement to other destinations of 1.9 million bushels was up 125 percent from the same period last year.

[1] Counties with less than 500 acres planted are combined into "other" counties to avoid disclosure of individual information.

[2] Planted acres less winter wheat acres replanted to spring wheat.

JANUARY AGRICULTURAL PRICES RECEIVED

Montana crop prices for the full month of January were lower with the exception of malt barley. Winter wheat declined 21 cents to $4.14 per bushel, while durum wheat dropped $1.15 to $4.19 per bushel. Spring wheat was down 27 cents to $4.15 per bushel. Feed barley decreased 6 cents to $2.33 and malt barley dropped 7 cents $3.37 per bushel. At $1.52 per bushel oats averaged 33 cents lower than the previous month. Alfalfa hay climbed $21.00 to $106.00 a ton and other hay increased $16.00 to $88.00 per ton. The all wheat price for mid-February averaged $4.12 per bushel and the all barley price was $2.47. Mid-February prices for alfalfa hay continue to increase at $117.00 a ton and other hay was up to $93.00 a ton.

Livestock prices for the full month of January were higher than the previous month, with the exception of milk. Steers and heifers saw a $5.20 cent increase to $67.50 per cwt. Cows increased 70 cents to $33.30, while the average price for calves was up $5.40 to $70.10 per cwt. Sheep rose $4.00 to $41.80 per cwt and lambs jumped $7.10 to $104.00 per cwt. Milk prices dropped $2.00 to $13.50 per cwt. Steer and heifer prices for mid-February averaged $69.30 per cwt.

Nationally, steer and heifer prices averaged $65.20 per cwt for the full month of January. Cow prices came in a $30.00 and hogs were $53.80 per cwt. The U.S. all wheat price was $4.03 per bushel and $2.53 per bushel for all barley. Egg prices were 76 cents per dozen.

The All Farm Products Index of Prices Received in February was 105 based on 1990-92=100, down 3 points (2.8 percent) from January. Price declines from January for lettuce, broilers, wheat, and hogs more than offset price increases for soybeans, tomatoes, hay, and tobacco. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. Lower seasonal marketings of corn, tobacco, soybeans, and cotton more than offset the relatively higher marketings of milk, cattle, hogs, and broilers. These changes contributed two points of the three point decrease in the overall index.

Compared with February 1996, the All Farm Products Index was 1 point (0.9 percent) lower. Price decreases from February 1996 for corn, wheat, potatoes, and lettuce more than offset price increases for cattle, hogs, broilers, and hay.

UNITED STATES INDEX SUMMARY

MONTANA 1996 ALFALFA SEED PRODUCTION

Montana alfalfa seed production during 1996 rose nearly 47 percent from last year. Seed production totaled 5.06 million pounds compared with 3.45 million pounds produced in 1995. Proprietary varieties made up 61 percent of this year's production, up slightly from last year. Common uncertified varieties accounted for 29 percent of the production and common certified varieties made up the remaining 10 percent.

Producers harvested 11,500 acres of seed, down 800 acres from a year ago. The decrease in harvested acreage was offset by extremely good yields. The state average yield was estimated at a record 440 pounds per acre, 50 pounds more than the previous record set in 1994. Non-irrigated acreage and yield fell from the previous year, but were offset by a significant increase in acreage and yield of the irrigated crop.

The average price received for the 1996 crop was $1.18 per pound, up 11 cents from 1995's average price.

MONTANA 1996 CROP VALUES

The value of Montana's 1996 all wheat crop fell over 21% from 1995 to $711.5 million. Drought like conditions lowered production of the 96 crop from a year ago and the preliminary season average price fell $.63 from a year ago to $4.00 per bushel.

The estimated value of Montana's winter wheat crop totaled $240.8 million, down 5% from 1995. Although production rose to a more normal level, a lower season average price brought down the value of production. The winter wheat season average price was set at $3.80, down $.82 from a year ago. Other spring wheat value of production fell nearly 28 percent from last year to $442.4 million. Production fell 20% from 1995 and the season average price dropped $.44 from 1995 to $4.15 per bushel. The durum wheat season average price also fell, and is estimated at $4.20 per bushel, down $.89 per bushel.

Total value of production for barley was set at $154.8 million, down 17% from last year. The season average remained the same as last year at $3.00, but lower production brought down the total crop value.

All hay value of production fell 6% from a year ago and is estimated at $326.9 million. The preliminary season average price rose $3.00 from last year to $69.00 per ton.

MONTANA DOWN, U.S. BEEF PRODUCTION SETS RECORD HIGH FOR JANUARY

Montana slaughter plants produced 1.4 million pounds, dressed weight, of red meat during January 1997, down 28 percent from last year, and slightly lower than last month. There were 1,700 head of cattle slaughtered, compared to 2,300 last year during this time. The average liveweight of 1,108 pounds was down 34 pounds from a year ago.

January slaughter of hogs amounted to 1,500 head, down 800 head from last January. The average liveweight was 224 pounds, 10 pounds lighter than a year ago. Sheep slaughter, at 200 head, remained unchanged from last year. The average liveweight was up 15 pounds from a year ago to 129 pounds.

Commercial red meat production for the United States totaled 3.74 billion pounds during January. This production was down 2 percent from the previous year. Beef production, at 2.22 billion pounds, was up slightly from the previous record set in January, 1996. Cattle slaughter totaled 3.25 million head, up 3 percent from a year earlier. The average live weight was down 30 pounds from the previous year, at 1,160 pounds.

Veal production totaled 31.0 million pounds, up slightly from last year. Calf slaughter totaled 146,600 head, 2 percent above a year ago. The average live weight was down 6 pounds to 344 pounds.

Pork production, at 1.46 billion pounds, was down 6 percent from the previous year. Hog kill totaled 7.76 million head, 6 percent below a year earlier. The average live weight was unchanged from the previous year at 257 pounds.

Lamb and mutton production totaled 20.0 million pounds, down 13 percent from the previous low for January set in 1996 and 1979. Sheep slaughter totaled 304,400 head, down 16 percent from a year earlier. The average live weight was up 5 pounds to 131 pounds.

U.S. CATTLE ON FEED

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.31 million head on February 1, 1997. The inventory was 4 percent above February 1, 1996.

Placements in feedlots during January totaled 1.87 million, 21 percent above a year ago. Net placements were 1.78 million. During January, placements of cattle and calves weighing less than 600 pounds were 408,000, 600-699 pounds were 652,000, 700-799 pounds were 515,000, and 800 pounds and greater were 292,000. Marketings of fed cattle during January totaled 2.02 million, 5 percent above a year ago. Other disappearance totaled 92,000 during January, 42 percent above the previous year.

Cattle on Feed in Historic 7 States Up 6 Percent

Cattle on feed February 1, 1997, in the historic 7 States for feedlots with capacity of 1,000 or more head totaled 8.78 million, up 6 percent from the previous year and 8 percent above February 1, 1995.

Placements in feedlots during January totaled 1.64 million, 25 percent above a year ago and 1 percent above January 1995. Marketings during January totaled 1.74 million, 7 percent above a year ago and 17 percent above January 1995. Other disappearance during January was 65,000 head, 33 percent above a year ago and 10 percent above January 1995.

U.S. HIRED WORKERS UP 7 PERCENT, WAGES UP 4 PERCENT

There were 766,000 hired workers on the Nation's farms and ranches during the week of January 12-18, 1997, up 7 percent from a year earlier. There were 635,000 workers hired directly by farm operators.

Agricultural service employees on farms and ranches made up the remaining 131,000 workers. Migrant workers accounted for 9.5 percent of the January hired workforce compared to 5.7 percent last year.

Farm operators paid their hired workers an average wage of $7.19 per hour during the January 1997 survey week, up 30 cents (4.0 percent) from a year earlier. Field workers received an average of $6.60 per hour, up 27 cents. Livestock workers earned $6.52 per hour compared with $6.20 a year earlier.

MONTANA HONEY PRODUCTION DOWN 17 PERCENT, UNITED STATES DOWN 6 PERCENT

Montana's honey producers with five or more colonies produced 7.02 million pounds of honey in 1996, down 10 percent from the previous year. There were 117,000 colonies producing honey in 1996, compared with 106,000 colonies in 1995. The yield per colony decreased 20 pounds from last year to 60 pounds per colony. The cooler spring and hot, dry and windy summer contributed to the lower yield. Stocks on hand December 15, 1996, totaled 1.83 million pounds, up 2 percent from 1995.

The average price per pound received by Montana apiarists was 88 cents, up from the 72 cents received in 1995. The 1996 value of production for Montana's honey was 6.2 million dollars, compared with 6.1 million dollars a year ago.

United States honey production in 1996 from producers with five or more colonies totaled 198 million pounds, down 6 percent from 1995. There were 2.57 million colonies producing honey in 1996, compared with 2.65 million in 1995. Yield per colony averaged 77.2 pounds, down 2.3 pounds from the 79.5 pounds in 1995. Colonies which produced in more than one State were counted in each State and yields per colony may be understated. Producer honey stocks were 47.0 million pounds on December 15, 1996, up 11 percent from a year earlier.

Prices for the 1996 crop averaged a record high 89.4 cents per pound, up 31 percent from the previous record price of 68.5 cents in 1995. Prices are based on retail sales by producers and sales to private processors and co-ops. At the U.S. level, prices for each color are derived by weighting State average prices by the State quantities sold. Prices were higher for all color classes in 1996.

MONTANA POTATO STOCKS UP 10 PERCENT, U.S. UP 17 PERCENT

Montana producers stored 2.9 million cwt. of potatoes on February 1, 1997, compared with 2.6 million cwt. a year ago. The February 1 stocks represent 89 percent of 1996 production, one percent above the percentage held a year earlier.

The 15 major potato States held 220 million cwt of potatoes on February 1, 1997, up 17 percent from a year earlier and 9 percent above 1995. Storage accounted for 50 percent of 1996 fall production in the storage States, up two points from last year. Stocks by type were 3 percent reds, 15 percent whites, and 82 percent russets with more russets and fewer whites than a year ago.

Disappearance from the start of harvest to February 1 was 221 million cwt of potatoes, up 8 percent from the same period a year earlier and 7 percent above two years ago. Disappearance during January was 36.1 million cwt, up 5 percent from last year but slightly less than two years ago. Shrink and loss to date was estimated at 23.9 million cwt, up 4 percent from last year.

Processing gained 6 percent to 109 million cwt so far this season and was 11 percent above two years ago. In January, processors claimed 16.4 million cwt of potatoes, up 2 percent from last year but 2 percent short of two years ago.

Western States held 158 million cwt of potatoes in storage on February 1, 1997, 17 percent above a year ago and 5 percent above two years ago. Oregon's stocks were up substantially at 63 percent above last year, and Colorado jumped 34 percent from year-ago levels. Both States were more than 30 percent above two years ago. Washington's stocks were up 20 percent. Idaho, with about half the Western stocks, was up 6 percent. California's potato stocks were 11 percent below a year ago.

FALL POTATOES: PRODUCTION AND STOCKS ON FEBRUARY 1, 1996-97

MONTANA AND U.S. ANNUAL MILK PRODUCTION DOWN SLIGHTLY

Montana milk cows produced 307 million pounds of milk during 1996, down 2 percent from 1995. There was an average of 20,000 milk cows producing milk in 1996, 1,000 less than a year earlier. The average pounds of milk produced per cow increased to 15,350 pounds in 1996 up from 15,000 pounds in 1995. The number of operations with one or more milk cows decreased to 800 in 1996 compared with 900 in 1995.

U.S. milk cows produced 154.3 billion pounds of milk during 1996, compared with 155.4 billion pounds in 1995, a 1 percent decrease. There were 9.4 million cows producing milk in 1996, down 100,000 head from last year. These 9.4 million cows produced an average of 16,498 pounds of milk each, up fractionally from the previous year. There were 126,800 operations with milk cows in 1996, down 10,230 from the previous year.

Milk production in the 20 major States during January totaled 11.1 billion pounds, slightly below production in these same States in January 1996. December revised production, at 11.0 billion pounds was 1 percent above December 1995. During 1996, milk production was 1.16 billion pounds less than 1995. On a daily basis, 1996 production averaged 3.16 million pounds per day less than 1995.

Production per cow in the 20 major States averaged 1,426 pounds for January, 11 pounds above January 1996. The number of cows on farms in the 20 major States was 7.76 million head, 91,000 head less than January 1996 and 10,000 head less than December 1996. This is the eighteenth consecutive month of decline. The number of cows on farms averaged 107,000 less during 1996 when compared to 1995. The number of milk cows on farms was the lowest on record.

During the October-December period, the 20 major States produced 32.3 billion pounds of milk, 85.2 percent of the U.S. production. If the remaining 30 States not surveyed monthly followed the same pattern as the 20 States, the U.S. production would be 13.0 billion pounds for January 1997.

JANUARY EGG PRODUCTION UP 2 PERCENT

U.S. egg production totaled 6.55 billion during January 1997, up 2 percent from the 6.40 billion produced a year ago. Production included 5.57 billion table eggs and 982 million hatching eggs, of which 920 million were broiler-type and 62.0 million were egg-type. The total number of layers during January 1997 averaged 303 million, up 1 percent from the average number of layers during January 1996. January egg production per 100 layers was 2,162 eggs, compared with 2,141 in January 1996.

All layers in the U.S. on February 1, 1997, totaled 302 million, up 1 percent from a year ago. The 302 million layers consisted of 248 million layers producing table or commercial type eggs, 50.8 million layers producing broiler-type hatching eggs, and 2.68 million layers producing egg-type hatching eggs. Rate of lay per day on February 1, 1997, averaged 68.9 eggs per 100 layers, up 1 percent from the 68.1 a year ago.

Laying flocks in the 30 major egg production States produced 6.21 billion eggs during January, up 3 percent from January 1996. The average number of layers during January, at 287 million, was up 2 percent from the year earlier.

JANUARY 1, 1997 CATTLE AND CALF INVENTORY

Montana's cattle and calf inventory totaled 2.7 million head on January 1, 1997, down 2 percent from a year ago, according to the Montana Agricultural Statistics Service. The reduction was mainly in the inventories of steers and non-replacement heifers weighing more than 500 pounds. The non-replacement heifer inventory of 205,000 head was down 23 percent from last year and steers, at 300,000 head, were down 9 percent. Part of the drop in other heifer and steer inventories can be attributed to poor grazing conditions last year that resulted in lower weaning weights. The lower weaning weights resulted in more calves weighing less than 500 pounds on January 1. The number of calves increased 11 percent from last year to 150,000 head, but the calf inventory was still down from two years ago.

The number of beef cows that had calved remained unchanged from the previous year at 1.59 million head. The number of milk cows in the state equaled last year, at 20,000 head, after declining the previous four years. Beef heifer replacements, weighing 500 pounds or more, rose 6 percent to 350,000 head, but the number of heifer replacements is still below two years ago. Milk heifer replacements was unchanged from the previous year at 7,000 head. The number of bulls weighing 500 pounds or more increased 5 percent to 98,000 head.

During 1996, there were 1.54 million calves born in Montana, unchanged from the previous year. Calving conditions were poor last spring as spring snowstorms and unusually cold temperatures caused higher calf death losses. Information about the number of cattle and death losses during 1996 will not be available until April 25, 1997.

The number of cattle and calves on full feed that will be sent directly to slaughter, at 85,000 head, dropped 19 percent from the previous year. Cold weather and large amounts of snow has made cattle feeding difficult throughout most of the state. There are concerns about having adequate supplies of hay and the price of hay. Cattle and calves were moved from summer ranges earlier than a year ago due to the lack of grass or early snow fall. As of January 14th, 94 percent of cattle and sheep were receiving supplemental feed compared to 73 percent the previous year.

All cattle and calves in the United States as of January 1, 1997, totaled 101.2 million head, 2 percent below the 103.5 million on January 1, 1996 and 2 percent below the 102.8 million two years ago.. Beef cows, at 34.3 million, were down 3 percent from January 1, 1996 and 2 percent below two years ago. Milk cows, at 9.28 million, were down 1 percent from January 1, 1996.

The 1996 U.S. calf crop was estimated at 39.6 million, down 2 percent from 1995 and down 1 percent from 1994.

The number of operations in the U.S. with cattle totaled 1,194,390 during 1996, down 1 percent from 1995 and 2 percent below 1994. Beef cow operations in 1996 were down 1 percent from both 1995 and 1994. Milk cow operations were 7 percent below last year and 15 percent below two years ago.

U.S. CATTLE ON FEED UP 2 PERCENT

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.56 million head on January 1, 1997. The inventory was 2 percent above January 1, 1996. The inventory included 6.40 million steers and steer calves, down 4 percent from the previous year. This group accounts for 61 percent of the total inventory. Heifers and heifer calves accounted for 4.07 million head, up 12 percent from 1996.

Placements in feedlots during December totaled 1.70 million, 2 percent below 1995. Net placements were 1.61 million. During December, placements of cattle and calves weighing less than 600 pounds were 480,000, 600-699 pounds were 536,000, 700-799 pounds were 418,000, and 800 pounds and greater were 261,000. Marketings of fed cattle during December totaled 1.68 million, 1 percent above 1995. Other disappearance totaled 86,000 during December, 26 percent above the previous year.

SPECIAL THANKS TO all livestock producers responding to our January 1 cattle and sheep inventory surveys. Field and telephone enumerators contacted almost 2,000 Montana farmers and ranchers early in January. Names were selected on a statistical probability basis. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics for a more efficient production and marketing system.

JANUARY SHEEP AND LAMB INVENTORY DOWN IN MONTANA AND U.S.

The number of sheep and lambs on Montana farms and ranches totaled 432,000 head on January 1, 1997. The sheep and lamb inventory is down 7 percent from last year, a new record low. Some producers are downsizing their flocks due to predator problems and fluctuating prices in the market.

Total breeding sheep and lambs decreased 30,000 head from last year to 400,000. Many producers reported not keeping replacement lambs this year. Some producers cited high prices as being a factor in selling their lambs. Some plan on buying replacements in the spring. Other producers reported not keeping replacements because they are decreasing their flock size. Ewes one year and older were down 5 percent at 330,000 head. The 1996 lamb crop was down 5 percent at 390,000 head.

Market sheep and lambs totaled 32,000 head with market lambs making up 94 percent of the total. Thirteen percent of the market lambs were under 65 pounds, 27 percent were 65-84 pounds, 47 percent 85-105 pounds, and 13 percent were over 105 pounds.

There were 2,200 sheep operations in Montana during 1996, unchanged from 1995.

All sheep and lamb inventory in the United States on January 1, 1997, totaled 7.94 million head, down 6 percent from 1996 and 11 percent below two years ago. Inventory has slowly declined since 1942 when all sheep and lambs reached it's peak of 56.21 million head. Breeding sheep inventory reached 5.85 million head on January 1, 1997, down 6 percent from last year's 6.23 million head. Ewes one year old and older, at 4.84 million head, were 6 percent below last year's record low.

Market sheep and lambs on January 1, 1997 totaled 2.09 million head, down 7 percent from January 1, 1996. Market lambs comprised 96 percent of the total. Twenty-three percent were under 65 pounds, 18 percent were 65 - 84 pounds, 31 percent 85 - 105 pounds, and 24 percent were over 105 pounds.

The 1996 U.S. lamb crop was a record low 5.28 million head, down 6 percent from 1995. This compares with the previous record low of 5.61 million head set a year ago. The 1996 lambing rate was 103 per 100 ewes one year old and older on hand January 1, 1996, compared with 106 in 1995.

The number of operations with sheep during 1996 totaled 77,010, down 5 percent from 1995 and 12 percent from 1994.

AGRICULTURAL PRICES RECEIVED FOR DECEMBER MOSTLY HIGHER

Montana crop prices for the full month of December were higher with the exception of malt barley. Winter wheat rose 20 cents to $4.35 per bushel, while durum wheat jumped 60 cents to $5.34 per bushel. Spring wheat went up 16 cents to $4.42 per bushel. Feed barley increased 7 cents to $2.39 and malt barley dropped a dime to $3.44 per bushel. At $1.85 per bushel oats averaged 31 cents higher than the previous month. Alfalfa hay climbed $9.00 to $85.00 a ton and other hay soared upward $12.00 to $72.00 per ton. The all wheat price for mid-January averaged $4.16 per bushel and the all barley price was $2.82. Mid-January prices for alfalfa hay continue to increase at $106.00 a ton and other hay was up to $88.00 a ton. Comments from farmers and ranchers indicate hay supplies are low and prices are continuing to increase as producers try to locate enough hay to carry their livestock through the winter.

Livestock prices for the full month of December were higher than the previous month, with the exception of milk. Steers and heifers saw an 80 cent increase to $62.30 per cwt. Cows increased 20 cents to $32.60, while the average price for calves was up $2.20 to $64.70 per cwt. Sheep rose $6.40 to $37.80 per cwt and lambs jumped $8.50 to $96.90 per cwt. Milk prices dropped $1.70 to $15.50 per cwt. Steer and heifer prices for mid-January averaged $65.50 per cwt.

Nationally, steer and heifer prices averaged $65.50 per cwt for the full month of December. Cow prices came in at $28.30 and hogs were $55.60 per cwt. The U.S. all wheat price was $4.06 per bushel and $2.73 per bushel for all barley. Egg prices were 87.7 cents per dozen.

The All Farm Products Index of Prices Received in January was 108 based on 1990-92=100, down 2 points (1.8 percent) from December. Price declines from December for milk, eggs, hogs, and lettuce more than offset price increases for cattle, calves, hay, and soybeans. The seasonal changes in the mix of commodities farmers sell also affect the overall index level, however, these changes were essentially offsetting in January. Compared with January 1996, the All Farm Products Index was unchanged. Price increases from January 1996 for cattle, hogs, soybeans, and lettuce were offset by price decreases for wheat, corn, potatoes, and cotton.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Dec. 1995	Jan. 1996	Dec. 1996	Jan. 1997
Prices Received	108	108	110	108
Prices Paid, Interest, Taxes, & Farm Wage Rates 1/	112	113	115	116
Ratio 2/	96	96	96	93

1/ Prices paid indexes (1990-92=100) published monthly beginning January 1996. Indexes for 1995 were constructed for historical comparisons. 2/ Ratio of index of prices received by farmers to index of prices paid.

1996 EGG PRODUCTION AND CHICKEN INVENTORY

Montana chickens produced 108 million eggs during the year ending November 30, 1996, up 3 percent from last year. Our state averaged 378,000 layers in 1996, compared with 371,000 the previous year. The annual average production per layer on hand was 286 eggs, up one percent from a year ago.

There were 470,000 total chickens on Montana farms and ranches on December 1, 1996, compared with 540,000 on hand last year. The December 1, 1996 inventory included 197,000 layers 20 weeks old, 43,000 between 13 and 20 weeks old, and 56,000 pullets 13 weeks and under. The total value of all chickens on December 1, 1996, was 1.50 million dollars, up 11 percent from the previous December. The average value per bird was up 70 cents from last year to $3.20.

U.S. egg production during the year ending November 30, 1996 totaled 76.1 billion eggs, up 2 percent from the previous year's total of 74.6 billion eggs. Layer numbers during 1996 averaged 297 million, up 1 percent from the year earlier. The annual average production per layer on hand in 1996 was 255 eggs, compared with the 1995 average of 253 eggs per layer.

The total number of chickens on hand on December 1, 1996 (excluding commercial broilers) was 386 million birds, up fractionally from last year. Potential layers (layers 20 weeks old and older, plus pullets 13 weeks and older but less than 20 weeks) on hand December 1, 1996, totaled 335 million, up 1 percent from December 1, 1995. Of the 335 million potential layers, 91 percent were 20 weeks old and older and the remainder were pullets 13 weeks and older but less than 20 weeks.

The total value of all chickens on December 1,1996 was $1.03 billion, up 10 percent from December 1, 1995. The average value increased from $2.42 per bird on December 1, 1995 to $2.66 per bird on December 1, 1996.

U.S. DECEMBER EGG PRODUCTION UP 2 PERCENT

U.S. egg production totaled 6.68 billion during December 1996, up 2 percent from the 6.52 billion produced in 1995. Production included 5.69 billion table eggs and 983 million hatching eggs, of which 923 million were broiler-type and 60.0 million were egg-type. The total number of layers during December 1996 averaged 304 million, up 2 percent from the average number of layers during December 1995. December egg production per 100 layers was 2,198 eggs, compared with 2,183 in December 1995.

All layers in the U.S. on January 1, 1997, totaled 304 million, up 2 percent from a year ago. The 304 million layers consisted of 250 million layers producing table or commercial type eggs, 50.9 million layers producing broiler-type hatching eggs, and 2.66 million layers producing egg-type hatching eggs. Rate of lay per day on January 1, 1997, averaged 70.5 eggs per 100 layers, up 1 percent from the 69.9 a year ago.

Laying flocks in the 30 major egg production States produced 6.33 billion eggs during December, up 3 percent from December 1995. The average number of layers during December, at 288 million, was up 2 percent from the year earlier.

ANNUAL CROP PRODUCTION - 1996

Montana wheat growers planted the largest wheat acreage on record for the 1996 season. A more lenient farm bill and strong wheat prices were the major factors for the increase. Producers planted 6.63 million acres of wheat, up 16% from 1995 and up nearly 5% from the previous record in 1989. What started out to be another record production year was hurt by drought-like conditions across the state beginning in July. Yield forecast dropped monthly as very little rain fell. Total all wheat production was estimated at 176.71 million bushels, off 10% from last year's very large output.

Growers were able to plant a more normal winter wheat acreage in the fall of 1995 with better seeding conditions than the last few years. Winter wheat planted acreage was set at 2.15 million acres with growers able to harvest 1.98 million acres. Winter wheat planted acreage was up 650,000 acres from the 1995 season. Yield was estimated at 32 bushels per acre, down 8 bushels from last year. Total production was set at 63.36 million bushels, up 16% from last year only because of the large increase in acreage.

Other spring wheat planted acreage was set at 4.2 million acres, the largest acreage since 1953 when other spring wheat and durum wheat were recorded together. Harvested acreage was set at 4.1 million acres. Total production was estimated at 106.6 million bushels, the third largest other spring wheat crop on record, but again only due to the large amount of acreage planted. Yield for other spring wheat was set at 26 bushels per acre, down 9 bushels from last year.

Durum wheat planted acreage was estimated at 280,000 acres planted, with 270, 000 harvested. Planted acreage is up 4% from last year. Total production was 6.75 million bushels, down 15% from last year, yields averaged 25 bushels per acre, down 5 bushels from last year.

Barley production totaled 51.6 million bushels, down 17% from last year. Yields averaged 43 bushels per acre, down 9 bushels from 1995. Growers planted 1.3 million acres and harvested 1.2 million acres--both acreages are unchanged from 1995.

Oat production was set at its lowest level since 1889, with total production at 2.0 million bushels. Total production was down 58% from a year ago. Planted acreage was set at 100,000 acres, the lowest level since records began for planted acres in 1929, and down 45,000 from last year. Farmers harvested 50,000 acres, the smallest acreage since 1885. Yields averaged 40 bushels per acre, down 19 bushels from last year.

Row crops, which are primarily irrigated in Montana, faired very well in 1996. Corn production was estimated at 2.06 million bushels on 15,000 acres harvested for grain. A record state average yield was set at 137 bushels per acre, up 17 bushels from last year. Sugar beet production was estimated at 1.3 million tons, with yields averaging 22.6 tons per acre. Montana dry bean growers also realized record yields in 1996, with yields averaging 22.8 cwt. per acre. Total dry bean production was estimated at 235,000 cwt. Fall potato production in Montana totaled 3.2 million cwt., up 10 percent from last year. Yields were up 15 cwt. from last year's average 315 cwt. per acre.

Although there was a slight increase in harvested acres of all hay in Montana, lower yields with the drought-like conditions lowered total production by more than 8 percent from last year. Total harvested acres were estimated at 2.6 million, up 200,000 from last year. All hay average yields were set at 1.89 tons per acre, down 0.34 ton from last year. Alfalfa harvested acreage was set at 1.7 million acres, up 100,000 acres, with yields averaging 2.1 tons per acre compared with 2.5 tons per acre in 1995. Other hay harvested acreage was set at 900,000 acres with yields averaging 1.5 tons per acre.

CHERRY PRODUCTION

Montana production of sweet cherries was estimated at 700 tons, down 200 tons from 1995's revised estimate of 900 tons. This year's crop was hit with cool wet weather during pollination causing a decrease in total production. Utilized production totaled 630 tons. Favorable weather during picking season allowed for some very nice cherries and a decrease in the amount culled. The average price was $1,420 per ton, up $210 from a year ago, for a total production value of $893,000.

U.S. sweet cherry production in 1996 was estimated at 154,300 tons, down 7 percent from 1995. Utilized production totaled 151,880 tons. The U.S. average price was $1,470, up $210 from a year ago.

MONTANA ANNUAL CROP SUMMARY, 1993-96 1/

Crop	Year	Acreage		Yield Per Acre	Total Production	Season Avg Price	Value of Production	US Production
		Planted	Harvested					
		Thousands		Bushels	Thousands		Thousands	Thousands
Winter Wheat	1993	2,650	2,450	**42.0	102,900	$3.26	$335,454	1,760,143

MONTANA POTATO STOCKS UP 9 PERCENT, U.S. POTATO STOCKS JUMP 15 PERCENT

Montana producers stored 3.0 million cwt. of potatoes on January 1, 1997, compared with 2.7 million cwt. a year ago. The January 1 stocks represent 92 percent of production from the 1996 crop, the same percentage held a year earlier.

The 15 major potato States held 257 million cwt of potatoes on January 1, 1997, up 15 percent from a year earlier and 8 percent above 1995. Storage accounted for 58 percent of 1996 fall production up 1 point from last year. Stocks by type were 3 percent red, 17 percent white, and 80 percent russet.

Disappearance from the start of harvest to January 1 was a record 185 million cwt of potatoes, up 9 percent from the same period a year ago. December disappearance was 34.8 million cwt, up 5 percent from last year and 1 percent above two years ago. Shrink and loss to date was estimated at 21.1 million cwt, up 5 percent from last year.

Processing gained 7 percent to 93.1 million cwt so far this season and was 14 percent above two years ago. In December, processors used 15.3 million cwt of potatoes, down 5 percent from last year and 4 percent below two years ago.

Western States held 180 million cwt of potatoes in storage on January 1, 1997, up 15 percent from a year previous and 4 percent above two years ago. Each of the Western storage States were above last year except California, where stocks dipped 14 percent.

Oregon is up 60 percent, Colorado's storage jumped 27 percent, and Washington stocks increased 20 percent from a year ago. Idaho is up 5 percent. These four States account for 68 percent of U.S. potato stocks, and their combined stocks are 16 percent above last year.

MONTANA DECEMBER MILK PRODUCTION UNCHANGED, U.S. PRODUCTION DOWN SLIGHTLY

During the October-December quarter, Montana milk cows produced 77 million pounds of milk, unchanged from the same quarter a year ago. Montana milk cow numbers remained at 20,000 head.

Grain and other concentrates fed to Montana's milk cows on January 1 averaged 17.7 pounds per day, slightly lower than the 18.0 pounds per day a year earlier. The value of grain and other concentrates fed to cows on January 1, averaged $8.40 per cwt, up 60 cents from January 1, 1996.

Milk production in the 22 major States during December totaled 11.1 billion pounds, slightly below production in these same States in December 1995. During 1996, milk production was 1.2 billion pounds less than 1995. On a daily basis, 1996 production averaged 4.4 million pounds per day less than 1995.

Production per cow in the 22 major States averaged 1,394 pounds for December, 14 pounds above December 1995. The number of cows on farms in the 22 major States was 7.94 million head, 97,000 head less than December 1995 and 6,000 head less than November 1996. This is the seventeenth consecutive month of decline. The number of cows on farms averaged 101,000 less during 1996 when compared to 1995. The number of milk cows on farms was the lowest on record.

During the October-December period, the 22 major States produced 32.7 billion pounds of milk, 86.4 percent of the U.S. production. If the remaining 28 States not surveyed monthly followed the same pattern as the 22 States, the U.S. production would be 12.7 billion pounds for October 1996, 12.4 billion pounds for November 1996, 12.8 billion pounds for December 1996.

The quarterly production of milk for the U.S. was 37.9 billion pounds, slightly above the October-December period in 1995. The average number of milk cows in the U.S. during the October-December quarter was 9.32 million head, 114,000 less than the same period a year earlier.

Grain and other concentrates fed to milk cows on January 1, 1997, averaged 19.2 pounds per cow, 0.4 pound more than January 1, 1996. The value of grain and other concentrates fed to cows on January 1, averaged $8.79 per cwt, 28 cents more than a year ago.

MONTANA AND U.S. RED MEAT PRODUCTION DOWN FROM A YEAR AGO

Montana slaughter plants produced 1.4 million pounds, dressed weight, of red meat during December 1996, down 3 percent from last year, but up 7 percent from last month. Cattle slaughter, at 1,600 head, was unchanged from last year. The average live weight of 1,185 pounds was up 10 pounds from a year ago.

There were 1,700 head of hogs slaughtered in Montana during December, down 300 head from a year ago. The average live weight, at 238 pounds, dropped 3 pounds from last year. Sheep slaughter amounted to 200 head, down 100 head from last year. The average live weight of 115 pounds remained the same as a year ago.

Commercial red meat production for the United States totaled 3.43 billion pounds during December, decreasing 3 percent from the previous year. Beef production, at 1.95 billion pounds, was down 2 percent from December 1995. Cattle slaughter totaled 2.88 million head, up 2 percent from a year ago. The average live weight dropped 32 pounds from the previous year, at 1,160 pounds.

Veal production totaled 31.0 million pounds, up 19 percent from a year earlier. Calf slaughter totaled 152,900 head, 19 percent above a year earlier. The average live weight was down 2 pounds to 352 pounds.

Pork production, at 1.43 billion pounds, decreased 5 percent from the previous year. Hog kill totaled 7.62 million head, 6 percent below last year. The average live weight rose 1 pound to 258 pounds.

Lamb and mutton production totaled 22.0 million pounds, down 3 percent from the previous low for December set in 1995. Sheep slaughter totaled 348,400 head, dropping 6 percent from a year earlier. The average live weight increased 4 pounds to 130 pounds.

January-December red meat production was 43.1 billion pounds, down 1 percent from the comparable period a year ago. Accumulated beef production rose 1 percent, veal jumped 20 percent, pork decreased 4 percent, and lamb and mutton dropped 6 percent.

LATE SEASON CROPS

Montana producers harvested 15,000 acres of **corn for grain** in 1996, down 1,000 acres from last year. A record state average yield was set at 137 bushels per acre, up 17 bushels from last year. The increased yield offset the lower acreage and production rose 7 percent from last year to 2.06 million bushels. Corn for Silage acreage was estimated at 39,000 acres, up slightly from 1995. Yields averaged 21 tons per acre up 1 ton from last year.

U.S. corn for grain production was estimated at 9.29 billion bushels, up 26 percent from 1995, but virtually unchanged from the November 1 forecast. The U.S. yield of 127.1 bushels per acre was up 13.6 bushels from 1995, but 11.5 bushels below the record of 1994.

Sugar beet producers in Montana harvested an estimated 57,500 acres of beets this year, up 2,000 acres from a year ago. Yields improved from a year ago averaging 22.6 tons per acre up 1.1 tons from last year. Total production was estimated at 1.3 million tons, up 10 percent from a year ago.

U.S. Sugar beet production is expected to total 26.6 million tons, a decrease of 5 percent from 1995. Area for harvest, at 1.32 million acres, is down 7 percent from last year. Yield per acre averaged 20.1 tons per acre, up 0.3 tons from the previous year's yield.

Montana **dry bean** growers produced an estimated 235,000 cwt. of dry beans in 1996. Production was up 30,000 cwt. from 1995. This is the largest crop produced since 1966. Growers harvested 10,300 acres with a record yield of 22.8 cwt. per acre.

U.S. dry edible bean production is estimated at 27.4 million cwt. for 1996, 11 percent below 1995 and 6 percent below two years ago. Area for harvest is estimated at 1.72 million acres, down 10 percent from 1995 and 6 percent below 1994. The average yield, at 1,592 pounds per acre, fell 30 pounds below 1995, but was 10 pounds above 1994.

Fall potato production in Montana totaled 3.2 million cwt., up 10 percent from last year. Producers harvested 10,200 acres compared with 9,800 in 1995. Yields were up 15 cwt. from last year and averaged 315 cwt. per acre.

U.S. production of fall potatoes in 1996 is estimated at a record high 452 million cwt., 12 percent above last year and 6 percent above two years ago. This is the fifth record production of potatoes in the United States in the last six years. Area harvested, at 1.25 million acres, is up 3 percent from the last two years. The average yield is estimated at 363 cwt. per acre, a jump of 29 cwt. from last year and 11 cwt. above two years ago.

Although there was a slight increase in harvested acres of **all hay** in Montana, lower yields with the drought-like conditions lowered total production by more than 8 percent from last year. Total harvested acres were estimated at 2.6 million, up 200,000 from last year. All hay average yields were set at 1.89 tons per acre, down 0.34 ton from last year. Alfalfa hay harvested acreage was set at 1.7 million acres, up 100,000 acres, with yields averaging 2.1 tons per acre compared with 2.5 tons per acre in 1995. Other hay harvested acreage was set at 900,000 acres with yields averaging 1.5 tons per acre.

Nationally, **all hay** production for 1996 was estimated at 149 million tons, down 3 percent from 1995 and down slightly from the output of two years ago. The average yield, at 2.45 tons per acre, was down 5 percent from the previous year.

Lower hay production and early feeding of hay has brought Montana's December 1 **hay stocks** down 5 percent from last year. Hay stocks were estimated at 4.67 million tons on December 1. The early winter feeding has many producers concerned about having enough hay to last through the season. Hay prices have risen significantly and many producers are not finding any hay to buy.

U.S. stocks of all hay on farms December 1, 1996 totaled 105 million tons, 4 percent below the stocks on farms December 1, 1995. Stocks decreases occurred in 30 of the 48 contiguous States, mainly in the northern and western States where 1996 all hay production was also down.

WINTER WHEAT SEEDINGS

Drought-like conditions last fall lead Montana winter wheat growers to seed the second smallest winter wheat crop since 1970. Estimated winter wheat seedings for the 1997 crop were set at 1.65 million acres, down 500,000 acres from last year. Only the 1995 acreage was smaller at 1.5 million acres. Many producers did not get enough moisture to seed and when moisture did arrive it was too late. Seeding was 95 percent completed by October 20. Snow cover so far this year has been rated mostly fair to good. Only a limited amount of wind damage has been reported. As of December 31 the crop condition was rated at 2 percent very poor, 9 percent poor, 46 percent fair, 26 percent good, and 17 percent excellent.

U.S. winter wheat growers have seeded, or intend to seed, 48.2 million acres of winter wheat for 1997 harvest. The estimated level is down 7 percent from last year, and, if realized, will be the smallest winter seeded area since 1978.

Hard red winter wheat seeded area is estimated at 34.1 million acres, down 5 percent from last year. Increased area in Colorado was more than offset by acreage decreases in the Great plains from Oklahoma to the Canadian border. Wetness hampered Kansas seeding during September; rains continued to delay or prohibit planting in the eastern third through November. Adequate rainfall in the Panhandle and southwestern areas of Nebraska encouraged producers to seed wheat; late row crop harvests curtailed plantings elsewhere.

PLEASE RETURN

NOVEMBER AG PRICES RECEIVED

Montana crop prices for the full month of November were mixed. Winter wheat dropped 15 cents to $4.15 per bushel, while durum wheat went up 34 cents to $4.74 per bushel. Spring wheat decreased 9 cents to $4.26 per bushel. Feed barley slipped 16 cents to $2.32 and malt barley increased 4 cents to $3.54 per bushel. Oats fell 40 cent to $1.54 per bushel. Alfalfa hay climbed $3.00 to $76.00 a ton and other hay rose $2.00 to $60.00 per ton. The all wheat price for mid-December averaged $4.20 per bushel and the all barley price was $2.98.

Livestock prices for the full month of November were higher than the previous month, with the exception of cows and lambs. Steers and heifers saw a $1.00 increase to $61.50 per cwt. Cows fell 60 cents to $32.40 while average prices for calves were up $1.50 to $62.50 per cwt. Sheep jumped $4.40 to 31.40 per cwt and lambs decreased $2.10 to $88.40 per cwt. Milk prices increased 80 cents to $17.20 per cwt. Steer and heifer prices for mid-December averaged $62.10 per cwt.

Nationally, steer and heifer prices averaged $68.70 per cwt for the full month of November. Cow prices came in at $28.00 and hogs were $54.40 per cwt. The U.S. all wheat price was $4.14 per bushel and $2.65 per bushel for all barley. Egg prices were 82.7 cents per dozen.

The All Farm Products Index of Prices Received in December was 108 based on 1990-92=100, down 2 points (1.8 percent) from November. Price declines from November for wheat, cattle, milk, corn, oranges, and lettuce more than offset price increases for broilers, eggs, cottonseed, and strawberries. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. However, these changes were essentially offsetting in December.

Compared with December 1995, the All Farm Products Index was unchanged. Price increases from December 1995 for hay, hogs, eggs, broilers, soybeans, and grapes were offset by price decreases for wheat, potatoes, corn, cotton, and sorghum.

UNITED STATES INDEX SUMMARY

DECEMBER 1, 1996 GRAIN STOCKS

Montana all wheat stocks were estimated at 126.8 million bushels on December 1, 1996, down only 2% from stock levels at this time a year ago. Disappearance since September 1, 1996 totaled 43.5 million bushels, down 35% from the disappearance level for this period last year, but only 1% more than the 10-year average.

Montana barley stocks on December 1 were estimated at 33 million bushels, down 2 million bushels from December 1, 1995. This is the smallest December level since 1985. Oat stocks, at 2.55 million bushels, are down 44% from last year. This is also the lowest level for this time period since records resumed for oat stocks in 1989.

U.S. all wheat stocks in all positions on December 1, 1996 totaled 1.22 billion bushels, down 9% from a year ago to the lowest December 1 total since the reference date was changed in the 1986-87 marketing year. Durum wheat stored in all positions on December 1, 1996, at 86.1 million bushels, was up 21% from last December 1.

U.S. barley stored in all positions on December 1, 1996, is estimated at 248 million bushels, up 2% from the stocks December 1, 1995. Oats stored in all positions on December 1, 1996 are estimated at 129 million bushels, down 16% from the stocks of December 1, 1995.

MONTANA HOG INVENTORY DOWN 17 PERCENT, U.S. DOWN 4 PERCENT

There were 150,000 hogs in Montana's inventory on December 1, 1996, down 17 percent from last December's total. The decrease in inventory was the result of producers adjusting to an increase in the price of feed and the decrease in the price of hogs. The breeding herd was reduced to 16,000 head compared with 19,000 head on hand December 1, 1995. Market hogs and pigs accounted for 134,000 head, down from 161,000 head last December 1. The 1996 pig crop was estimated at 323,000 head, down 7 percent from the pig crop in 1995. The average litter rate for 1996 was 8.75 compared with 8.45 in 1995. There were 750 operations with hogs and pigs during 1996, down from 900 operations in 1995.

U.S. inventory of all hogs and pigs on December 1, 1996, was 56.2 million head. This was 4 percent below December 1995 and 3 percent below the September 1, 1996 inventory. This is the lowest December inventory since 1990.

Breeding inventory, at 6.66 million head, is the smallest December 1 breeding herd on record. This total is down 3 percent from December 1, 1995 and down 2 percent from September 1, 1996. Market hog inventory, at 49.5 million head, was 4 percent below both last year and last quarter.

The September-November 1996 U.S. pig crop, at 23.2 million head, was 1 percent less than 1995 and 6 percent less than 1994. Sows farrowing during this period totaled 2.72 million head, 3 percent below last year. Litter rate increases continue at a record level, with an average of 8.52 pigs saved per litter for the September-November period. Last year the litter rate averaged 8.34 pigs per litter. Pigs saved per litter by size of operation ranged from 7.30 for operations with 1-99 hogs to 8.80 for operations with more than 2,000 hogs and pigs.

U.S. hog producers intend to have 2.77 million sows farrow during the December 1996-February 1997 quarter, 1 percent more than the actual farrowings during the same period last year, but 4 percent lower than 1995. Intended farrowings for March-May 1997, at 2.89 million sows, are 2 percent below 1996 and 9 percent below the 1995 period. The December-May intentions utilize 84.9 percent of the breeding herd, compared with 83.5 percent for actual farrowings last year and the 5 year average of 85.0 percent.

The number of operations with hogs totaled 157,450 during 1996, down 13 percent from last year and 24 percent below 1994. Places with 2,000 or more hogs on hand accounted for 3 percent of the operations and 51 percent of the inventory. This is the first time operations with inventories over 2,000 head have controlled over 50 percent of the total inventory. The number of operations with inventory over 5,000 head, at 1,400 operations, accounted for 33 percent of the total inventory. The total number of hogs under contract (owned by the over 5,000 head operations, but raised by contractees) accounted for 21 percent of the total U.S. hog inventory.

Milk Production
Red Meat Production
Egg Production
Potato Production
Ag Land Values
Montana Malting Barley

U.S. CATTLE ON FEED

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 10.60 million head on December 1, 1996.

Placements in feedlots during November totaled 2.33 million. Net placements were 2.24 million. During November, placements of cattle and calves weighing less than 600 pounds were 799,000, 600-699 pounds were 678,000, 700-799 pounds were 537,000, and 800 pounds and greater were 319,000. Marketings of fed cattle during November totaled 1.72 million. Other disappearance totaled 93,000 during November.

NOVEMBER U.S. MILK PRODUCTION UP SLIGHTLY

Milk production during November in the 22 major States totaled 10.6 billion pounds, slightly above production in these same States in November 1995. October revised production, at 11.0 billion pounds, was virtually unchanged from October 1995.

Production per cow in the 22 major States averaged 1,339 pounds for November, 19 pounds above November 1995. The number of cows on farms in the 22 major States was 7.94 million head, 104,000 head less than November 1995 and 14,000 head less than October 1996. This is the sixteenth consecutive month of decline.

During the July-September period, the 22 major States produced 32.8 billion pounds of milk, 86.7 percent of the U.S. production. If the remaining 28 States not surveyed monthly followed the same pattern as the 22 States, the U.S. production would be 12.3 billion pounds for November 1996.

MONTANA AND U.S. RED MEAT PRODUCTION DOWN IN NOVEMBER

Montana slaughter plants produced 1.3 million pounds, dressed weight, of red meat during November 1996, down 14 percent from last year and down 23 percent from last month. The drop in red meat production was due to a decreased number of cattle and hogs being slaughtered in the state. Cattle slaughter, at 1,500 head, was down 200 head from last year. The average live weight of 1,179 pounds was down 3 pounds from a year ago.

There were 1,500 head of hogs slaughtered in Montana during November, down 600 head from a year ago. The average live weight, at 245 pounds, was down 1 pound from last year. Sheep slaughter amounted to 300 head which was the same as a year ago. The average live weight increased 3 pounds from last year to 117 pounds.

Commercial red meat production for the United States totaled 3.44 billion pounds during November, down 9 percent from the previous year. Beef production, at 1.96 billion pounds, was down 7 percent from November 1995. Cattle slaughter totaled 2.87 million head, down 4 percent from a year earlier. The average live weight was down 22 pounds from the previous year at 1,165 pounds.

Veal production totaled 30.0 million pounds, up 13 percent from a year earlier. Calf slaughter totaled 144,700 head, 12 percent above a year ago. The average live weight was up 2 pounds to 358 pounds.

Pork production, at 1.43 billion pounds, was down 11 percent from the previous year. Hog kill totaled 7.62 million head, 11 percent below a year earlier. The average live weight was unchanged at 258 pounds.

Lamb and mutton production totaled 21.0 million pounds, down 9 percent from the previous low for November set in 1995. Sheep slaughter totaled 335,900 head, down 11 percent from a year earlier. The average live weight was up 3 pounds to 127 pounds.

January-November red meat production was 39.7 billion pounds, down 1 percent from the comparable period a year ago. Accumulated beef production rose 2 percent, veal jumped 20 percent, pork decreased 4 percent, and lamb and mutton was dropped 7 percent.

U.S. NOVEMBER EGG PRODUCTION UP 3 PERCENT

U.S. egg production totaled 6.40 billion during November 1996, up 3 percent from the 6.23 billion produced in 1995. Production included 5.46 billion table eggs and 937 million hatching eggs, of which 878 million were broiler-type and 59.0 million were egg-type. The total number of layers during November 1996 averaged 301 million, up 2 percent from the average number of layers during November 1995. November egg production per 100 layers was 2,124 eggs, compared with 2,109 in November 1995.

All layers in the U.S. on December 1, 1996, totaled 303 million, up 2 percent from a year ago. The 303 million layers consisted of 251 million layers producing table or commercial type eggs, 49.7 million layers producing broiler-type hatching eggs, and 2.53 million layers producing egg-type hatching eggs. Rate of lay per day on December 1, 1996, averaged 71.4 eggs per 100 layers, up 1 percent from the 71.0 a year ago.

Laying flocks in the 30 major egg production States produced 6.06 billion eggs during November, up 3 percent from November 1995. The average number of layers during November, at 285 million, was up 2 percent from the year earlier.

MONTANA POTATO STOCKS UP 8 PERCENT, U.S. UP 14 PERCENT

Montana's 1996 potato production, at 3.21 million cwt., is 9 percent above production a year ago and is a record high for the state. Stocks on hand December 1 amounted to 3.05 million cwt. which is 95 percent of production and 8 percent above last year's December 1 stocks.

Montana growers planted 10,400 acres of potatoes in 1996. Freezing and other losses reduced the harvested acres to 10,200 which is 4 percent above last year. The average yield of 315 cwt. per acre is up 15 cwt. from a year ago.

The 15 major potato States held 292 million cwt. of potatoes on December 1, 1996, up 14 percent from last year and 7 percent above the previous record in 1994. Storage accounted for 66 percent of 1996 fall production compared with 65 percent in 1995. Stocks by type were 4 percent red, 17 percent white, and 79 percent russet. There were more reds and russets, but fewer whites than a year ago.

Disappearance in the 15 States from the start of harvest to December 1 was a record high 150 million cwt. of potatoes, up 10 percent from the same period in 1995. Shrinkage and loss so far was estimated at 18.4 million cwt, up 6 percent from the 17.4 million cwt. lost in 1995, but 1 percent below the 18.6 million cwt. lost from the 1994 crop. Processing is heavy with 80.0 million cwt. taken by fryers and dehydrators in eight major States so far this season. This is a gain of 12 percent over a year ago and 21 percent above two years ago.

Western States held 201 million cwt. of potatoes in storage on December 1, 1996, up 13 percent from a year ago and 4 percent above two years ago. Oregon's storage jumped 45 percent above a year ago. Colorado was up 25 percent and Washington was up 22 percent. Idaho's stocks increased 3 percent from last year, but were below those of two years ago. California's storage dropped 10 percent.

Production of fall potatoes in 1996 is estimated at a record high 452 million cwt, 12 percent above last year and 6 percent above two years ago. This is the fifth record production of potatoes in the United States in the last six years. The December 1 forecast is less than 1 percent above the November forecast. A substantial increase in final yield data in Washington more than offset downward adjustments in other States. Area harvested, at 1.25 million acres, is up 3 percent from the last two years. The average yield is estimated at 363 cwt. per acre, a jump of 29 cwt. from last year and 11 cwt. above two years ago. Planting started late but good weather in June turned the season into one of the best ever in most States. Total U.S. potato production from all four seasons was a record high 496 million cwt. in 1996, 12 percent above a year earlier and 6 percent above the previous record in 1994.

Ten Western States produced 311 million cwt. in 1996, up 12 percent from last year and 4 percent above two years ago. Acreage for harvest, at 751,800 acres, was up 5 percent, while the average yield of 413 cwt. per acre rose 27 cwt. from a year ago. Idaho's production of 140 million cwt. is 6 percent above last year and slightly larger than the previous record high two years ago. Some frost damage on both ends of the season kept the crop from being even larger. Production in Washington gained by late season reports of high yields. This year's production was 17 percent larger than last year and 7 percent above the previous record high. Oregon's production jumped 29 percent from last year and was 16 percent larger than two years ago. Ideal weather and growing conditions in Colorado produced a record crop of potatoes, 21 percent higher than last year. California, Utah, and Wyoming produced smaller potato crops than last year, by 14, 4, and 43 percent, respectively. New Mexico's crop was smaller than earlier expected, but gained 7 percent on last year. Nevada's crop was 11 percent larger than a year ago.

AGRICULTURAL LAND VALUES

- U.S. farm real estate values averaged $890 per acre as of January 1, 1996--7.0 percent above a year earlier. This represents an inflation-adjusted increase of 4.4 percent.

- The largest increase occurred in the Appalachian, Mountain, and Corn Belt regions (11.2, 9.8, and 9 percent).

- The per-acre value of U.S. farm real estate has increased 49 percent since the 1987 upturn.

- The per-acre value of **Montana** farm real estate has increased 45 percent since 1987.

A 7-percent increase in the per-acre value of **U.S.** farm real estate (land and buildings) during 1995 was the strongest of 9 consecutive yearly gains since the upturn in values began in 1987. By comparison, the value increases were 6.4 percent in both 1994 and 1993. The per-acre value of U.S. farm real estate has increased almost 49 percent since the 1987 upturn. The average nominal value of $890 per acre as of January 1, 1996, compares with $823 recorded in 1982, just before the major decline in farm real estate values that occurred during the mid-1980's. It was not until January 1995 that farm real estate values exceeded the 1982 level.

On a real (or inflation-adjusted basis), U.S. farm real estate values increased 4.4 percent during 1995. This compares with 4.0 and 3.5 percent increases during 1994 and 1993. Prior to 1993, real values had fallen for 10 of 12 years. In real terms, the January 1, 1996, average was still 40 percent below the 1981 peak.

Several States in the Lake, Corn Belt, Appalachian, and Mountain regions recorded double-digit increases in farm real estate values. All States showed increases except New York and Oklahoma.

Average regional values have been increasing since 1986 or 1987 for all regions except the Southern Plains. Since the 1986/87 low point, the Northeast has experienced an 85 percent increase. Other areas where average values have increased more than the National average include the Corn Belt (75 percent), Lake (59 percent), Appalachian (59 percent), and Southeast (57 percent) regions. Those regions with the smallest increases include the Southern Plains (15 percent), Delta (33 percent) and Northern Plains (44 percent). The trend in values for the Southern Plains has run counter to other regions for much of the 1980's and 1990's. Average values in the Southern Plains increased into 1985, while values for most other regions declined beginning in 1981. The Southern Plains average value then declined between 1985 and 1992, while over most of that period (1987-92), values increased in all other regions.

Montana's per-acre value of farm real estate of $289 was up 4.5 percent from 1995's average value of $277. The 1996 value rose less than other states in the Mountain region which averaged 9.8 percent above a year earlier.

MONTANA MALTING BARLEY UTILIZED TO PRODUCE MALT--1995 CROP

Maltsters and brewers purchased 20.1 million bushels of Montana's 1995 barley crop to make malt. This was 32 percent more than 1994 and 47 percent more than 1993. The average protein of the 1995 malting barley purchases was 11.8 percent. This is 0.3 lower than the 12.1 percent last year and 0.3 higher than the 11.5 percent for 1993.

Montana growers planted 1.3 million acres of barley in 1995. Of the total, about 477 thousand acres were planted to malting varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley then approximately 22.9 million bushels of malting type barley would be produced. Since 20.1 million bushels were used for malt the remaining 2.8 million bushels either did not make the malting grade or exceeded the demand for malting barley. The 1995 malt barley utilization represented 32 percent of the total 1995 barley crop compared with 29 percent of the total in 1994 and 22 percent in 1993.

"Happy Holidays"

from all of us at the Montana Agricultural Statistics Service! As 1996 comes to a close, we should take a moment to reflect on what has happened this year. Farmers in Montana planted and harvested a record number of acres of wheat in 1996. Coming off a great 1995 crop year, farmers were optimistic that production would also be up. Nevertheless, drought-like conditions starting in June and prevailing until after harvest, adversely effected yields. Montana farmers did not set a record wheat production during 1996, but the quality of grain produced was outstanding.

Good news! This fall the cattle market has shown signs of improvement. We appear to have hit the bottom of the cattle cycle and are on our way back up. We hope that prices will continue to rise.

To everyone involved in Montana's agriculture, thanks for your continued support. Because of the voluntary cooperation of Montana's farmers and ranchers, we can provide sound statistical facts ensuring that basic agricultural information is available about Montana's number one industry.

We sincerely hope that you and your family have a joyous and safe holiday season and that 1997 is a great year for Montana's agricultural industry.

PLEASE RETURN

WORLD EXPORT DEMAND SLUGGISH

If world export demand for beef remains sluggish over the next couple of quarters as supplies increase, more production will have to be absorbed domestically, possibly along with larger beef imports as other countries seek alternative markets for their beef. Third-quarter U.S. beef exports were down 13 percent from a year ago, the first quarterly year-to-year decline since the fall of 1993. Tight U.S. supplies of higher quality beef and higher prices undoubtedly contributed to the decline. In addition, E. coli problems in Japan remain a concern and the dollar remains strong against Korea's won. Exports to Japan were down 20 percent from third-quarter 1995, while exports to the Republic of Korea were down 35 percent.

Third-quarter beef imports were up 3 percent from a year earlier and up 5 percent from the second quarter. Imports from Australia were even with a year earlier, but up 41 percent from the spring quarter. However, imports from New Zealand were down 28 percent from a year earlier and down 35 percent from the spring quarter. Canadian exports to the U.S. of beef and slaughter cattle remained large as U.S. supplies of higher quality beef remain tight and prices were strong. Imports from Southern Hemisphere countries typically decline in the fourth quarter as their spring grazing season begins, and imports from Canada will slow as U.S. supplies rise in late fall through spring.

U.S. per capita beef consumption will continue near 1995's 67.5 pounds in 1996 and 1997, and up half a pound from 1994. However, larger supplies of competing meats in second-half 1997 will hold down beef price gains. Retail prices for Choice beef averaged $2.80 a pound this past summer, but may rise to the mid-$2.80's this fall because of reduced Choice beef supplies in late summer-early fall. For the year, prices may average near $2.80 a pound, down about 4 cents from 1995. Prices in 1997 are likely to remain in the lower $2.80's for much of the year with a fairly flat pattern. While Choice and Prime beef supplies have been very tight, supplies of other beef have been sufficiently large to lower the October price for "All fresh beef" at retail to 7 cents below a year earlier.

BEEF HERD LIQUIDATION CONTINUES

Cow slaughter remains well above a year earlier and is rising seasonably as this year's calf crop is weaned. Continued weak feeder cattle prices and hay supply concerns, as winter approaches, are likely to encourage even closer culling of the cow herd. Although steer slaughter through the first three quarters of this year was down more than 1 percent from a year earlier, heifer slaughter was up nearly 4 percent, and cow slaughter was up 17 percent. Beef cow slaughter was up 27 percent.

Year-to-year increases in cow slaughter are expected to begin to phase down during the fourth quarter. Cow slaughter this fall may rise only about 6 percent from the already large year-earlier level. First-quarter 1997 cow slaughter, although large, is expected to decline 4 to 5 percent from the very large 1996 figure, but remain 6 percent above the 1992-95 average. Total cow slaughter is expected to rise 14 percent from a year earlier in 1996, and may decline 8 to 10 percent in 1997.

In addition to seasonably large cow slaughter this fall, fed cattle marketings are likely to begin to rise in response to larger feedlot placements beginning in July. However, the largest cow slaughter will likely be behind before fed cattle marketings show any appreciable increases.

SOURCE for articles on this page: Livestock, Dairy and Poultry Situation and Outlook, ERS, November 25, 1996

OCTOBER AG PRICES RECEIVED

Montana crop prices for the full month of October were down from the previous month, with the exception of malt barley, oats, and hay. Winter wheat decreased 22 cents to $4.30, while durum wheat slipped 34 cents to $4.40 per bushel. Spring wheat dropped 12 cents to $4.35 per bushel. Feed barley declined 10 cents to $2.48 per bushel, while malt barley improved 8 cents to $3.50 per bushel. Alfalfa hay rose $3.00 to $76.00 and other hay increased $2.00 to $60.00. The all wheat price for mid-November averaged $4.20 per bushel, while the all barley price was $2.80.

Livestock prices for the full month of October were lower across the board compared with the previous month, with the exception of milk. Cow prices averaged $1.90 below last month at $33.00 per cwt, while the average price for steers and heifers slipped 40 cents to $60.50 per cwt. Calf prices also dipped 40 cents to $61.00 per cwt. Prices received for sheep were down $5.90 to $27.00 per cwt, while lamb prices dropped $1.10 to $90.50 per cwt. Milk prices climbed 20 cents to $16.40 per cwt. Steer and heifer prices for mid-November averaged $61.40 per cwt.

Nationally, steer and heifer prices averaged $68.10 per cwt for the full month of October. Cow prices came in at $30.40 and hogs were $55.60 per cwt. The U.S. all wheat price was $4.18 per bushel and $2.73 per bushel for all barley. Egg prices were 74.6 cents per dozen.

The All Farm Products Index of Prices Received in November was 110 based on 1990-92=100, down 2 points (1.8 percent) from October. Price declines from October for corn, soybeans, oranges, and milk more than offset price increases for lettuce, cattle, grapes, and eggs. The seasonal changes in the mix of commodities farmers sell also affects the overall index level, however, these changes were essentially offsetting in November.

Compared with November 1995, the All Farm Products Index was 4 points (3.8 percent) higher. Price increases from November 1995 for hogs, cattle, grapes, and lettuce more than offset price decreases for corn, wheat, potatoes, and sorghum.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Oct. 1995	Nov. 1995	Oct. 1996	Nov. 1996

U.S. AND MONTANA NOVEMBER 1 CROP PRODUCTION HIGHLIGHTS

Montana growers harvested an estimated 1.29 million tons of sugar beets this fall, up 8 percent from last year. The yield forecast of 22.5 tons per acre was up 0.5 ton from last month and up 1 ton from last year. Growers harvested 57,300 acres this year, up 1,800 acres from 1995.

Sugar beet production for the U.S. is expected to total 26.8 million tons, a decrease of 4 percent from 1995. Area for harvest, at 1.32 million acres, is down slightly from October and down 7 percent from last year. The decline in harvested acreage is largely attributable to the discovery of duplicate acreage reported. The average yield, at 20.2 ton per acre, is up 0.4 ton from last year's yield.

Sugar beet harvest activity in the Red River Valley started in early September and was complete by the end of October, ahead of schedule with better than expected yields reported. Plant development in the Great Lakes started the month behind the average for the region, but was aided by a late frost and moderate weather during most of October. The harvest in the Great Lakes region was delayed by late October rains, but was virtually completed by the beginning of November. Frequent rains and hail in the High Plains late in the growing season lowered yield potential. The sugar beet harvest neared completion in the Mountain States, where hot, dry summer and fall weather caused some producers to wait for cooler weather to increase sugar content.

Montana's estimated potato production is set at 3.2 million cwt, up 9 percent from last year. A cool, wet spring held planting behind normal last spring. Harvesting was behind normal most of the fall. The crop was affected by some freeze damage. Yields averaged 315 cwt per acre, up 15 cwt. from last year. Producers harvested an estimated 10,200, up slightly from last year.

U.S. fall potato production for 1996 is forecast at a record high 448 million cwt, 11 percent above last year and 5 percent above the previous record high in 1994. Area harvested, at 1.25 million acres, is up 3 percent from last year. The average yield is projected at a record high 359 cwt per acre, up 25 cwt from last year and 7 cwt above two years ago. Planting started late this year, but warm June weather matured early varieties for a robust harvest season that ended earlier than normal and with good yields. Total potato production from all four seasons is 491 million cwt in 1996, up 11 percent from last year and 5 percent above 1994.

U.S. corn production is forecast at 9.27 billion bushels, 3 percent above the October 1 forecast and up 26 percent from 1995. This is the third largest production on record behind 1994 and 1992. Based on November 1 conditions, yields are expected to average 126.5 bushels per acre, up 3.5 bushels from last month and 13.0 bushels from 1995. Acreage harvested and to be harvested for grain is forecast at 73.3 million acres, unchanged from last month. Forecasted yields increased in all the major corn producing states due to favorable fall weather conditions.

NOVEMBER 1, 1996 PASTURE AND RANGE FEED CONDITION

The pasture and range feed condition fell slightly from last month. As of November 1, the condition was rated at 5 percent very poor, 29 percent poor, 40 percent fair, 25 percent good, and 1 percent excellent. Most livestock had been moved off summer ranges at this time, with just over 80 percent of the cattle and calves and over 80 percent of the sheep and lambs moved.

- Very Poor: Pastures and/or ranges are providing very little or no feed for the current time of the year. Supplemental feeding is required to maintain livestock.
- Poor: Pastures and/or ranges are providing only marginal feed for the current time of the year. Some supplemental feeding is required.
- Fair: Pastures and/or ranges are providing adequate feed but less than the normal amount expected for the current time of the year.
- Good: Pastures and/or ranges are providing the normal amount of feed for the current time of the year.
- Excellent: Pastures and/or ranges are providing feed in excess of what is normally expected for the current time of the year.

1996 CROP YEAR SUMMARY

The 1996 crop year, beginning with the fall seeding of winter wheat, started out much better than the previous year. Better seeding conditions in the fall of 1995 allowed farmers to plant a more normal acreage of winter wheat than the previous two years. Winter wheat seeding progressed ahead of normal with nearly all seeding done by the end of October.

For the most part the winter weather did not have much of a negative impact on the winter wheat crop. There was a very warm spell in February followed by very cold temperatures which did cause some apprehension among winter wheat producers. There were reports in the spring of localized winter kill, but when all was done, winter kill damage was near normal statewide.

It was another very cool and wet spring. Spring grain seeding did not really start until the 3rd week of April. By the end of April only 16% and 18% of the spring wheat and barley, respectively, were seeded, well behind the five-year average of nearly 50% complete. Winter wheat growth remained slow with the cool weather. The crop was rated 28% fair and 53% good. Soil moisture conditions across the state were rated mostly adequate.

The cool weather continued through the month of May. Seeding progress remained behind normal most of the month. Crop and pasture growth was stunted by the cool weather. By the end of the month only 59% of the spring wheat and 57% of the barley had emerged well behind the normal of nearly 70% for both crops. The winter wheat condition remained mostly in fair to good condition. Row crop planting also lagged behind normal at the end of May. Soil moisture conditions were still rated as mostly adequate to surplus.

Producers virtually finished all planting within the first week of June. Warmer weather allowed for good growing conditions over most of the state. Although soil moisture conditions were still rated mostly adequate, there were areas that were in need of moisture. Scattered hail damage was reported throughout the month. All the crops looked very good at this point as winter wheat, spring wheat and barley were rated approximately 30 percent fair and 50 percent good. Crop progress was still slightly behind normal. Pasture and ranges were rated in mostly good condition.

The weather turned for the worse in July, very warm temperatures persisted throughout the month and very little rain fell--except for localized thunderstorms. By the end of the month nearly three-fourths of the state reported soil moisture as being very short to short. What started out looking like a very good year for grains was turning for the worse. Crop conditions deteriorated with spring wheat and barley rated roughly 20 percent very poor to poor, 45 percent fair, 30 percent rated good, and 5 percent excellent. Winter wheat was only rated slightly higher. Winter wheat harvest started at the end of the month with 2 percent harvested statewide by the end of July. Spring wheat and barley started ripening at the end of the month. Grasshoppers were noted as a problem in scattered areas.

August continued as warm and dry. Winter wheat harvest was virtually complete by the end of the month. Spring wheat and barley harvest was three-fourths complete. Yields for wheat averaged over 20 percent less than the 1995 crop year. Barley yields were down 9 bushels from the previous year. The dry conditions caused critical fire danger situations. The pasture and ranges were rated mostly poor to fair.

September started out very dry. Spring grain harvest was virtually complete by the third week of September. The dry weather held many producers back from planting winter wheat. Much needed rain did fall over many parts of the state and producers were able to start seeding winter wheat. By the end of the month, 32% of the winter wheat was seeded, over 15 points behind normal. The crop had just started to emerge by the end of the month.

Scattered rains and snow during October brought some moisture relief. Producers were able to finish planting their winter wheat. Reports from some areas of the state indicated below normal winter wheat seeding because by the time moisture did arrive it was too late to seed. Row crop harvest was nearly complete by the end of the month. Producers were busy moving livestock off of summer ranges and doing some fall field work.

SEPTEMBER AG PRICES RECEIVED

Montana crop prices for the full month of September were down from the previous month, with the exception of oats, malt barley, and hay. Winter wheat dropped 63 cents to $4.52 per bushel, while durum wheat fell 81 cents to $4.74 per bushel. Spring wheat decreased 34 cents to $4.47 per bushel. Feed barley slipped 18 cents to $2.58 and malt barley increased 6 cents to $3.42 per bushel. Oats went up a penny to $1.92 per bushel. Alfalfa hay shot up $6.00 to $74.00 a ton and other hay rose $1.00 to $59.00 per ton. The all wheat price for mid-October averaged $4.43 per bushel and the all barley price was $3.07.

Livestock prices for the full month of September were higher than the previous month, with the exception of cows. Steers and heifers saw an 80 cent increase to $60.90 per cwt. Cows fell $2.70 to $34.90, while the average price for calves was up $1.60 to $61.40 per cwt. Sheep prices improved $1.20 to 32.90 per cwt and lambs were up $3.10 to $91.60 per cwt. Milk prices remained unchanged at $16.20 per cwt. Steer and heifer prices for mid-October averaged $60.90 per cwt.

Nationally, steer and heifer prices averaged $68.00 per cwt for the full month of September. Cow prices came in at $30.80 and hogs were $54.70 per cwt. The U.S. all wheat price was $4.37 per bushel and $2.79 per bushel for all barley. Egg prices were 76.8 cents per dozen.

The U.S. All Farm Products Index of Prices Received in October was 112 based on 1990-92=100, down 4 points (3.4 percent) from September. Price declines from September for wheat, milk, corn, and soybeans more than offset price increases for hogs, grapes, lettuce, and tomatoes. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. However, these changes were essentially offsetting in October.

Compared with October 1995, the All Farm Products Index was 8 points (7.7 percent) higher. Price increases from October 1995 for cattle, milk, hogs, and soybeans more than offset price decreases for wheat, potatoes, peanuts, and sorghum.

HIGHLIGHTS:

U.S. Egg Production
Hay Production
Sugar Beet Production
Quarterly Milk Production
Cattle on Feed
All Cattle & Calves by County
Beef Cows by County
Red Meat Production

U.S. SEPTEMBER EGG PRODUCTION UP 4 PERCENT

U.S. egg production totaled 6.25 billion during September 1996, up 4 percent from the 5.99 billion produced in 1995. Production included 5.31 billion table eggs and 938 million hatching eggs, of which 883 million were broiler-type and 55.0 million were egg-type. The total number of layers during September 1996 averaged 298 million, up 3 percent from the average number of layers during September 1995. September egg production per 100 layers was 2,094 eggs, compared with 2,065 in September 1995.

All layers in the U.S. on October 1, 1996, totaled 299 million, up 3 percent from a year ago. The 299 million layers consisted of 248 million layers producing table or commercial type eggs, 48.8 million layers producing broiler-type hatching eggs, and 2.53 million layers producing egg-type hatching eggs. Rate of lay per day on October 1, 1996, averaged 69.8 eggs per 100 layers, up 1 percent from the 69.1 a year ago.

Laying flocks in the 30 major egg production States produced 5.92 billion eggs during September, up 4 percent from September 1995. The average number of layers during September, at 282 million, was up 3 percent from the year earlier.

SUGAR BEET AND HAY PRODUCTION - OCTOBER 1, 1996

Montana producers intend to produce 1.26 million tons of sugar beets this year, if realized this would be slightly below last month's forecast, but 6 percent above last year's estimate. October's forecasted yield is one-half ton below the September forecast and one-half ton above last year. Harvested acreage remains unchanged, at 57,300 acres, up 3 percent from last year. Sugar beet harvest went into full swing at the beginning of this month with 25 percent of the acreage harvested by October 6.

Production for the U.S. is expected to total 26.4 million tons, a decrease of 6 percent from 1995. Area for harvest, at 1.33 million acres, is unchanged from the September "Crop Production" report, but down 6 percent from last year. The average yield, at 19.8 tons per acre, is equal to last year's yield and the September "Crop Production" report.

Montana's all hay production is forecast at 5.1 million tons, down 5 percent from last year and down 3 percent from the August forecast. Producers harvested 2.55 million acres with an estimated yield of 2 tons per acre. Alfalfa production is estimated at 3.74 million tons, down 6 percent from last year. Although producers harvested 100,000 acres more this year, at 1.7 million, a decrease in yield more than offset the increased acreage. Estimated yield was set at 2.2 tons per acre, down 0.3 ton from last year and down 0.1 ton from August's forecast. With drought-like conditions prevalent over most of the state starting in July, some producers were not able to get a second cutting. Other hay production was set at 1.36 million tons, unchanged from last year. Producers harvested 850,000 acres, up 50,000 acres from 1995, but yield dropped to 1.6 tons per acre this year compared with 1.7 tons per acre last year.

U.S. all hay production for 1996 is forecast at 152 million tons, up 2 percent from the August 1 forecast, but down 2 percent from 1995. The increase from August is a result of a 2 percent increase in expected average yields to 2.51 tons per acre. All hay yields, however, are down 3 percent from the previous year. Acreage harvested, at 60.6 million acres, is unchanged from August 1 and 1 percent above last year. Alfalfa hay production, at 80.7 million tons, is up fractionally from the August 1 forecast, but down 5 percent from the 1995 total. Area for harvest, at 24.3 million acres, is down 1 percent from a year ago. Average yields are forecast at 3.33 tons per acre, down 0.13 ton from the previous year. Dry conditions late in the season reduced second and third cutting yields in most areas across the northern half of the U.S. In the southern portion of the U.S., however, mild temperatures and ample precipitation during August and September resulted in additional cuttings and helped boost yields. Production of all other hay is forecast at 71.1 million tons, 4 percent above the quantity expected August 1 and 2 percent above the 1995 total. Area for harvest, at 36.3 million acres, is up 3 percent from last year. Yield per acre is expected to average 1.96 tons, down 1 percent from the 1995 yield.

See crop production table on following page.

CROP PRODUCTION FORECAST, OCTOBER 1, 1996

[1/] Preliminary. [2/] Planted for all purposes. [3/] Production forecast available November 12, 1996.

MONTANA JULY - SEPTEMBER MILK PRODUCTION DOWN 2 PERCENT, U.S. DOWN 1 PERCENT

Montana milk cows produced 78 million pounds of milk during the period of July-September 1996, compared with 77 million pounds last quarter and 80 million pounds the same quarter a year ago. The drop in production from the previous year is attributed to the decline in milk cow inventory which dropped 1,000 head from last year to 20,000 head.

Montana dairymen fed their milk cows 16.5 pounds of grain and other concentrates on October 1, up 0.3 pounds from the previous year. The value of the grains and other concentrates fed, at $8.40 per hundredweight, increased $1.15 per hundredweight from a year ago.

Milk production in the 22 major States during September totaled 10.7 billion pounds, 1 percent below production in these same States in September 1995. August revised production, at 11.0 billion pounds, was 1 percent less than August 1995.

Production per cow in the 22 major States averaged 1,341 pounds for September, 10 pounds above September 1995. The number of milk cows on farms in the 22 major States was 7.96 million head, 100,000 head less than September 1995, and 8,000 head less than August 1996. This is the thirteenth consecutive month of decline.

During the July-September period, the 22 major States produced 32.8 billion pounds of milk, 86.7 percent of the U.S. production. If the remaining 28 States not surveyed monthly followed the same pattern as the 22 States, the U.S. production would be 12.8 billion pounds for July 1996, 12.7 billion pounds for August 1996, 12.3 billion pounds for September 1996.

The quarterly production of milk for the U.S. was 37.8 billion, 1 percent below the July-September period last year. The average number of milk cows in the U.S. during the July-September quarter was 9.35 million head 120,000 head less than the same period last year.

Grain and other concentrates fed to milk cows on October 1, 1996, averaged 18.0 pounds per cow, 0.4 pound less than October 1, 1995. The value of grain and other concentrates fed to cows on October 1, averaged $9.53 per hundredweight, $1.56 more than October 1, 1995.

U.S. CATTLE ON FEED

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 8.84 million head on October 1, 1996. The inventory included 5.55 million steers and steer calves. This group accounts for 63 percent of the total inventory. Heifers and heifer calves accounted for 3.25 million head.

Placements in feedlots during September totaled 2.64 million. Net placements were 2.57 million. During September, placements of cattle and calves weighing less than 600 pounds were 413,000, 600-699 pounds were 519,000, 700-799 pounds were 870,000, and 800 pounds and greater were 841,000. Marketings of fed cattle during September totaled 1.56 million. Other disappearance totaled 70,000 during September.

MONTANA RED MEAT PRODUCTION DOWN 20 PERCENT

Montana slaughter plants produced 1.4 million pounds, dressed weight, of red meat during September--up 1 percent from last year, but down 20 percent from last month. Cattle slaughter, at 1,600 head, was up 100 head from a year ago. The average live weight at 1,217 pounds increased 20 pounds from last year.

There were 2,200 head of hogs slaughtered in September, down 200 head from a year ago. The average live weight increased 6 pounds from last year to 233 pounds. The number of sheep slaughtered decreased by 200 head from a year ago to 300 head. The average live weight, at 115 pounds, increased 4 pounds over last year.

U.S. commercial red meat production totaled 3.39 billion pounds during September, down 8 percent from the previous year. January-September red meat production was 32.4 billion pounds, up slightly from the comparable period a year earlier. Accumulated beef production rose 3 percent, veal jumped 20 percent, pork decreased 4 percent, and lamb and mutton fell 8 percent.

Beef production, at 1.94 billion pounds, was down 13 percent from September 1995. Head kill totaled 2.76 million head, down 11 percent from a year earlier. The average live weight was down 13 pounds from the previous year, at 1,179 pounds.

Veal production totaled 31.0 million pounds, up 21 percent from a year earlier. Calf slaughter totaled 149,700 head, 22 percent above a year earlier. The average live weight was down 9 pounds to 354 pounds.

Pork production, at 1.41 billion pounds, was down 2 percent from the previous year. Hog kill totaled 7.70 million head, 3 percent below a year earlier. The average live weight was unchanged at 251 pounds.

Lamb and mutton production, at 20.0 million pounds, was down 7 percent from the previous record low set in September 1995. Slaughter during September 1996 totaled 327,100 head, down 9 percent from a year earlier. The average live weight was up 3 pounds to 122 pounds.

Small Grains Summary
Quarterly Grain Stocks
Ag Prices Received

SEPTEMBER 1996 SMALL GRAIN SUMMARY

Montana wheat growers planted the largest wheat acreage on record for the 1996 season. A more lenient Farm Bill and strong wheat prices were the major factors for this. Producers planted 6.63 million acres of wheat, up 16% from 1995 and up nearly 5% from the previous record in 1989. Harvested acreage was estimated at 6.35 million acres. What started out to be another record production year was hurt by drought-like conditions across the state starting at the beginning of July. Yield forecasts were brought down monthly as very little rain fell anywhere across the state. All wheat yields averaged 27.8 bushels per acre, down over 8 bushels from last year. Total all wheat production was estimated at 176.71 million bushels, off 10% from last year's very large crop.

Growers were able to plant a more normal winter wheat acreage last fall with better seeding conditions than the last few years. Winter wheat planted acreage was set at 2.15 million acres with growers able to harvest 1.98 million acres. Winter wheat planted acreage was up 650,000 acres from the 1995 season. Yield was estimated at 32 bushels per acre, down 3 bushels from the August forecast and down 8 bushels from last year. Total production was set at 63.36 million bushels, up 16% from last year only because of the large increase in acreage.

Other spring wheat planted acreage was set at 4.2 million acres, the largest amount since 1953 when other spring wheat and durum wheat were recorded together. Harvested acreage was set at 4.1 million acres. Total production is estimated at 106.6 million bushels, the third largest other spring wheat crop on record, again, only due to the large amount of acres planted. Yield for other spring wheat was set at 26 bushels per acre, down 1 bushel from the September 1 forecast and down 9 bushels from last year. Durum wheat planted acreage was revised upward to 280,000 acres planted with 270,000 harvested, planted acreage is up 4% from last year. Total production was 6.75 million bushels, down 15% from last year, yields averaged 25 bushels per acre, down 5 bushels from last year.

Barley production totaled 51.6 million bushels, down 17% from last year. Yields averaged 43 bushels per acre, up 2 bushels from the September 1 forecast but down 9 bushels from 1995. Growers planted 1.3 million acres and harvested 1.2 million acres, both acreages are the same as 1995.

Oat production was set at its lowest level since 1889 with total production estimated at 2.0 million bushels. Total production was down 58% from a year ago. Planted acreage was set at 100,000 acres, the lowest level since records began for planted acres in 1929, and down 45,000 from last year. Farmers harvested 50,000 acres, the smallest amount since 1885. Yields averaged 40 bushels per acre, down 19 bushels from last year.

Nationally, all wheat production for 1996 totaled 2.28 billion bushels, down 1 percent from the September forecast, but up 5 percent from 1995. The U.S. yield was placed at 36.3 bushels per acre, up 0.5 bushels from 1995. Grain area was estimated at 62.9 million acres. This is slightly less than the last forecast, but up 3 percent from last season. The 1996 winter wheat production was estimated at 1.48 billion bushels, down 1 percent from the August forecast and 4 percent from 1995. Yields averaged 37.2 bushels per acre. This is down a tenth from the last forecast and a half bushel less than the 1995 average. Harvested area was estimated at 39.7 million acres, down 1 and 3 percent from August and last year, respectively. Other spring wheat production in 1996 was estimated at 688 million bushels, up slightly from the September forecast and 28 percent more than in 1995. This is the second highest production on record. Harvested area was 19.6 million acres, up a little from the last forecast to the highest level since 1919. The U.S. yield was 35.1 bushels per acre, unchanged from September but 2.9 bushels per acre over last year. Durum wheat production for 1996 was estimated to total 116 million bushels, up 2 percent from the last forecast and 13 percent more than in 1995. The U.S. yield is placed at 32.7 bushels per acre, down 0.3 bushels from the last forecast. Area for grain now totals 3.55 million acres, up 3 and 6 percent from the last forecast and 1995, respectively.

Barley production in 1996 was estimated at 397 million bushels, 10 percent above last year's estimate and the highest production since 1993. Average yield per acre, at 58.5 bushels, was up 1.2 bushels from 1995. The area harvested for grain was estimated at 6.79 million acres, 8 percent more than a year ago. This is the largest acreage since 1992 when 7.29 million acres were harvested. Oats production in 1996 was estimated at 155 million bushels, 4 percent below last year's crop, and was the lowest oat production estimated since 1866. Yields per harvested acre for grain averaged 57.8 bushels, up 3.1 bushels from 1995. Area harvested for grain, at 2.69 million acres, was down 9 percent from last year, and is the lowest harvested acreage since estimates were first made.

SEPTEMBER 1, 1996 GRAIN STOCKS

Montana all wheat stocks totaled 170.0 million bushels on September 1, down 13% from last year. Disappearance from June through September 1 totaled 34.21 million bushels, down 33% from last year. Stock levels are down 8% from the ten-year average. Winter wheat stocks were estimated at 52.2 million bushels, up 4% from 1995. All spring wheat stocks were set at 117.8 million bushels, down 19% from last year. Durum wheat stocks are down 13% from last year and set at 6.07 million bushels. Barley stocks are estimated at 42.0 million bushels and are at their lowest level for this time period since 1992. Barley stocks are 9% below last year's level. Oat stocks are estimated at 2.55 million bushels, down 45% from last year. This is the lowest level for this time period since records began. (continued on next page.)

SEPTEMBER 1, 1996 GRAIN STOCKS (continued)

At the U.S. level, all wheat in all storage positions on September 1, 1996 is estimated at 1.72 billion bushels, down 8 percent from September 1, 1995. This is the lowest September 1 stock level since the reference date was changed in the 1986-87 marketing year. Farm stocks total 826 million bushels and off-farm stocks are 898 million bushels. The on-farm total is up 11 percent from a year ago, but the off-farm level is down 21 percent. All wheat disappearance for the first quarter of the 1996-97 marketing year totals 934 million bushels, up 16 percent from the same period last year.

U.S. durum wheat stored in all positions on September 1, 1996 totaled 102 million bushels, up 5 percent from last September. On farm stocks, at 79.7 million bushels, are up 10 percent from last year. Disappearance from all positions is 39.1 million bushels, up 26 percent from June-August 1995.

U.S. barley stocks in all positions on September 1, 1996 are estimated at 315 million bushels, 1 percent above the September 1, 1995 stocks. Of the total barley stocks on hand, 194 million bushels are stored on farms, 3 percent below a year ago. However, September 1, 1996 off-farm stocks are 7 percent above last year at 122 million bushels. Indicated disappearance during the June-August quarter totaled 182 million bushels, 15 percent above the same period a year earlier.

U.S. oats, stored in all positions on September 1, 1996 , are estimated at 133 million bushels, 26 percent below the September 1, 1995 stocks. Of the total stocks on hand, 93.4 million bushels were stored on farm, 13 percent below this time last year. Off-farm stocks totaled 39.5 million bushels, 46 percent below a year earlier. Indicated disappearance during the June-August quarter totaled 89 million bushels, 7 percent above the same period a year earlier. (District stocks on back page.)

AUGUST PRICES RECEIVED

Crop prices received by Montana's grain producers were mostly down for the full month of August. While crop prices were mostly down from the previous month, all crop prices were higher than a year ago. Winter wheat decreased 10 cents from the previous month to $5.15 per bushel, spring wheat was down 53 cents to $4.81 per bushel, while durum wheat prices rose 22 cents to $5.55 per bushel. Malt barley prices were up 9 cents to $3.36 per bushel, while feed barley prices dropped 51 cents to $2.76. Alfalfa and other hay prices were each up from the previous month averaging $68.00 and $58.00 per ton, respectively. The all wheat and barley price for mid-September averaged $4.28 and $2.93 per bushel, respectively.

Ranchers in the state finally got some relief from spiraling cattle prices as prices for cows, calves, and steers and heifers were all up from the previous month, however prices were still below a year ago. Prices for cows rose $4.30 from the previous month to $37.60 per cwt, steers and heifer prices were up $1.20 to $60.10 per cwt., and calf prices jumped $4.90 to $59.80 per cwt. Sheep and lamb producers saw lower prices compared to July, however, prices were still above a year ago. Sheep prices dropped $1.80 per cwt. from last month to $31.70 per cwt., while lamb prices fell $11.10 to $88.50 per cwt. Milk prices in the state continued to climb as prices increased 80 cents from the previous month to a record high monthly price of $16.20 per cwt.. Mid-month September beef cattle and steer and heifer prices averaged $59.80 and $61.10 per cwt, respectively.

Nationally, winter wheat prices averaged $4.52 per bushel, spring wheat $4.63 per bushel, and the all barley price was $2.99 per bushel. U.S. hay prices averaged $96.00 per ton for alfalfa hay and $78.60 per ton for other hay. Livestock prices at the U.S. level for steers and heifers averaged $63.80 per cwt, sheep $29.10 per cwt, lambs $89.00 per cwt, and milk prices averaged $15.80 per cwt. During August, cows averaged $31.80 cwt. and calves averaged $59.20 per cwt. Hog prices for the full month of August averaged $59.70 per cwt. and egg prices averaged 74.4 cents per dozen.

The U.S. All Farm Products Index of Prices Received in September was 115 based on 1990-92=100, down 1 point (0.9 percent) from August. Price declines from August for corn, wheat, hogs, and potatoes more than offset price increases for cattle, milk, grapes, and tobacco. The seasonal changes in the mix of commodities farmers sell also affect the overall index level. The September mixture of commodities sold indicates relatively more soybeans, corn, apples, and potatoes and less cattle, wheat, broilers, and grapes, resulting in a slight upward influence on the index. However, these changes were not large enough to offset the influence of price declines from August. Compared with September 1995, the All Farm Products Index was 10 points (9.5 percent) higher.

UNITED STATES INDEX SUMMARY

INDEX 1990-92=100	Aug. 1995	Sept. 1995	Aug. 1996	Sept. 1996
Prices Received	102	105	116	115

- Red Meat Production
- Cattle on Feed
- Milk Production
- Potato Disposition
- Egg Production
- Cash Receipts

AUGUST RED MEAT PRODUCTION

Montana slaughter plants produced 1.8 million pounds, dressed weight, of red meat during August 1996, up 17 percent from last month, but down 4 percent from last year.

There were 2,000 head of cattle slaughtered in Montana, the same as a year ago. The average live weight increased 27 pounds from last year to 1,211 pounds.

Hog slaughter in Montana accounted for 2,400 head, down 700 head from the same month last year. The average live weight, at 230 pounds, increased 6 pounds from a year ago. Sheep and Lamb slaughter at 500 head was 100 head below the same time period last year. The average live weight increased 3 pounds from a year ago to 118 pounds.

United States commercial red meat production totaled 3.71 billion pounds during August, down 4 percent from the previous year. Beef production, at 2.26 billion pounds, was down 2 percent from August 1995. Head kill totaled 3.21 million head, down 1 percent from a year earlier. The average live weight was down 11 pounds from the previous year, at 1,177 pounds. Veal production totaled 32.0 million pounds. This production was up 25 percent from a year earlier. Calf slaughter totaled 157,800 head, 27 percent above a year earlier. The average live weight was down 4 pounds to 354 pounds.

Pork production, at 1.39 billion pounds, was down 7 percent from the previous year. Hog kill totaled 7.67 million head, 7 percent below a year earlier. The average live weight decreased 1 pound to 251 pounds. Lamb and mutton production, at 20.0 million pounds, was down 13 percent from the previous record low set in August 1979 and 1980. Slaughter during August 1996 totaled 329,700 head, down 11 percent from a year earlier. The average live weight was down 1 pound to 122 pounds.

January-August red meat production was 29.0 billion pounds, up 1 percent from the comparable period a year earlier. Accumulated beef production rose 5 percent, veal jumped 19 percent, pork dropped 4 percent and lamb and mutton fell 8 percent.

U.S. CATTLE ON FEED

Cattle and calves on feed for slaughter market in the United States for feedlots with capacity of 1,000 or more head totaled 7.83 million head on September 1, 1996.

Placements in feedlots during August totaled 2.27 million. Net placements were 2.22 million. During August, placements of cattle and calves weighing less than 600 pounds were 371,000, 600-699 pounds were 438,000, 700-799 pounds were 808,000, and 800 pounds and greater were 648,000. Marketings of fed cattle during August totaled 1.93 million. Other disappearance totaled 50,000 during August.

Cattle on Feed in Historic 7 Monthly States Down 8 Percent

Cattle on feed September 1, 1996, in the historic 7 monthly States for feedlots with capacity of 1,000 or more head totaled 6.61 million, down 8 percent from the previous year and 5 percent below September 1, 1994.

Placements in feedlots during August totaled 1.97 million, 19 percent above 1995 and 12 percent above 1994. Marketings during August totaled 1.65 million, 9 percent below 1995 but 3 percent above 1994. Other disappearance during August was 37,000 head, 7 percent below last year and 27 percent below 1994.

U.S. AUGUST MILK PRODUCTION DOWN 1 PERCENT

Milk production in the 22 major States during August totaled 10.9 billion pounds, 1 percent below production in these same States in August 1995. July revised production, at 11.1 billion pounds, was 2 percent less than July 1995. On a daily basis, 1996 milk production has been below 1995 levels every month this year.

The number of cows on farms in the 22 major States was 7.97 million head, 94,000 head less than August 1995 and 9,000 head less than July 1996. This is the twelfth consecutive month of decline. Production per cow in the 22 major States averaged 1,371 pounds for August, 4 pounds below August 1995. This is the fourth month in a row that the rate has been below a year ago.

During the April-June period, the 22 major States produced 34.3 billion pounds of milk, 86.2 percent of the U.S. production. If the remaining 28 States not surveyed monthly followed the same pattern as the 22 States, the U.S. production would be 12.7 billion pounds for August 1996.

MONTANA'S 1995 POTATO PRODUCTION DOWN 8 PERCENT; U.S. POTATO PRODUCTION DOWN 5 PERCENT

Montana's 1995 potato production totaled 2.94 million cwt., 8 percent below last year, but 9 percent above 1993. Producers harvested 9,800 acres, 200 acres less than a year ago and 800 acres above two years ago. Potato yields averaged 300 cwt. per acre compared with 320 cwt. last year.

Value of production from the 1995 crop was $27.5 million, up 25 percent from 1994. The average price was $9.35 per cwt., up $2.45 from the previous year's crop. Sales of Montana's 1995 potato crop totaled $24.9 million, a 26 percent increase from last year's crop. Producers sold 2.7 million cwt. from the 1995 crop compared with 2.9 million cwt. a year ago.

Total U.S. 1995 potato production was estimated at 444 million cwt., down 5 percent from the record high in 1994, but 3 percent above 1993. Harvested area, at 1.37 million acres, was down less than 1 percent from a year earlier, but 4 percent above 1993. The average yield of 323 cwt. per acre dropped 16 cwt. from 1994 and was 3 cwt. below 1993. Winter production in 1995 gained 4 percent from a year earlier, spring dropped 11 percent, and summer and fall combined for a decline of 5 percent.

Value of production was estimated at a record high $3.0 billion from the 1995 crop, up 15 percent from a year earlier and 13 percent above 1993. The average price was $6.77 per cwt. compared with $5.58 a year earlier and $6.17 from the 1993 potato crop.

Sales from the 1995 potato crop totaled 408 million cwt., down 4 percent from 1994, but 4 percent above 1993. Non-sales accounted for 35.3 million cwt. of 1995 potatoes, 18 percent less than the previous year and 2 percent less than 1993. Typically, 91 percent of potatoes produced are sold based on the past 5-year average. The other 9 percent are either lost (shrinkage and loss) or used for seed, home use, and livestock feed on farms where grown. In the 1995 season,
farmers sold 92.0 percent of their crop and kept or lost 8.0 percent.

Shrinkage and loss was estimated at 29.5 million cwt., The lowest since 1990 and 21 percent below 1994. Livestock feed and home use totaled 958,000 cwt., down 16 percent. Growers kept 4.79 million cwt. for seed on their own farms, a gain of 1 percent from the previous year.

Processors used 256 million cwt. of potatoes from the 1995 crop, down 2 percent from 1994, but 6 percent above the 1993 crop usage. Table stock totaled 124 million cwt., off 7 percent from last year. Other sales for seed and livestock feed of 28.8 million cwt. were up slightly.

Chip potato use totaled 47.9 million cwt., down 3 percent from a year earlier. Freezing potatoes totaled 156 million cwt., down 4 percent, while dehydrating claimed a record high 44.5 million cwt., up 7 percent. Canning use totaled 59.1 million cwt., up 7 percent. Starch, flour and other products were made from 1.7 million cwt. of potatoes, down 23 percent.

U.S. AUGUST EGG PRODUCTION UP 5 PERCENT

U.S. egg production totaled 6.46 billion during August 1996, up 5 percent from the 6.15 billion produced in 1995. Production included 5.47 billion table eggs and 985 million hatching eggs, of which 929 million were broiler-type and 56.0 million were egg-type. The total number of layers during August 1996 averaged 297 million, up 3 percent from the average number of layers during August 1995. August egg production per 100 layers was 2,172 eggs, compared with 2,135 in August 1995.

All layers in the U.S. on September 1, 1996, totaled 298 million, up 3 percent from a year ago. The 298 million layers consisted of 245 million layers producing table or commercial type eggs, 49.7 million layers producing broiler-type hatching eggs, and 2.50 million layers producing egg-type hatching eggs. Rate of lay per day on September 1, 1996, averaged 69.9 eggs per 100 layers, up 1 percent from 69.2 a year ago.

In the 30 major egg producing States, laying flocks produced 6.12 billion eggs during August, up 5 percent from August 1995. The average number of layers during August, at 281 million, was u percent from the year earlier.

MONTANA AGRICULTURAL STATISTICS SERVICE HAS GONE INTERNET!

Montana Agricultural Statistics Service has provided a homepage on the Internet for users to quickly and efficiently access information about Montana's Agriculture. The address is: http:/www.usda.gov/nass/SSO/MT/homepage.htm (the address IS case sensitive.)

Included are facts about Montana's rank in the Nation's agriculture, population, land utilization, annual crop summaries, livestock inventories and market-year-average prices. Also included are our up-to-date press releases about current crop condition, crop-weather, monthly agricultural prices, and other agricultural information. You can also e-mail comments or suggestio directly to our office.

The Montana homepage is part of the National Agricultural Statistics Service's homepage which has national releases along with links to other State Statistical Offices.

Plan to visit Montana Agricultural Statistics Service's homepage soon!

HIGHLIGHTS:

September 1 Crop Production
Pasture & Range Feed Condition
Ag Prices Received
Wheat & Barley Movement

SEPTEMBER 1 CROP PRODUCTION FORECAST

Montana's other spring wheat production estimate was lowered to 110.7 million bushels, down 4.1 million from the August forecast and, if realized, down 17% from last year's record crop. Most of the state continued to experience warm, dry conditions further deteriorating the crop. Harvest of the spring grains was well ahead of normal with about 80% of the spring wheat harvested by the end of the month. Forecasted yield is set at 27 bushels per acre, down 1 bushel from August 1 and down 8 bushels from last year. Harvested acreage remains at 4.1 million acres.

Estimated durum wheat production remains unchanged from last month at 5.6 million bushels. Durum yields are estimated at 25 bushels per acre, unchanged from last month and down 5 bushels from 1995.

Winter wheat production is not estimated as of September 1. The August winter wheat production forecast added to the all spring wheat production estimate totals 190.1 million bushels of all wheat, down 3% from last year.

Barley yield was lowered by 2 bushels from last month to 41 bushels per acre. Total production is forecast at 51.3 million bushels off nearly 5% from last month and down 18% from last year. Oat production is not estimated as of September 1, but the August 1 forecast was 2.6 million bushels.

Estimated sugar beet production remains unchanged from last month at 1.3 million tons, up 8% from last year. Yield is forecast at 22.5 tons per acre, up one ton from last year. New hay estimates will be available October 11. The August all hay production estimate was set at 5.27 million tons, down 2% from last year.

U.S. all wheat production is forecast at 2.30 billion bushels, up 2 percent from last month and 5 percent above the 1995 crop. The U.S. yield is placed at 36.4 bushels per acre, up 0.8 bushels from the last forecast.

Nationally, other spring wheat production is forecast at 687 million bushels, up 8 percent from last month and 28 percent from 1995. This production level is second only to the 1992 record of 758 million bushels. The U.S. yield is expected to average 35.1 bushels per acre, up 2.6 bushels from a month ago. Grain area is unchanged from last month. Lower Idaho yield prospects caused the drop in white spring wheat production. Hard red spring wheat production is up from last month because better-than-expected yields in Minnesota and the Dakotas more than covered Montana's decline.

Durum wheat production is forecast at 114 million bushels, down 5 percent from last month, but still up 11 percent from 1995. The U.S. yield is placed at 33.0 bushels per acre, down 1.6 bushels from the last forecast. Area for grain remains at 3.36 million acres. Yield increases in Minnesota and South Dakota were more than offset by a 2 bushel drop in the North Dakota yield forecast. The North Dakota decline is largely due to head scab related problems.

Barley production is forecast at 394 million bushels, up 2 percent from August and 10 percent above the 1995 production. The expected yield per acre is forecasted at 58.3 bushels compared with last month's 57.4 and last year's 57.2 bushels. Yield increases from August in Minnesota, North Dakota, and Wyoming more than offset declines in Montana, Oregon, and Washington. Area harvested and to be harvested was unchanged from August, at 6.76 million acres, up 8 percent from the previous year.

Sugar beet production for the U.S. is expected to total 26.4 million tons, a decrease of 6 percent from 1995. Area for harvest, at 1.33 million acres, is virtually unchanged from the August "Crop Production" report and down 6 percent from last year. The average yield, at 19.8 tons per acre, is equal to last year's yield, and up 0.3 tons from August.

Corn production is forecast at 8.80 billion bushels, up 19 percent from 1995 production. Based on conditions as of September 1, yields are expected to average 120.2 bushels per acre, up 1.5 bushels from last month and 6.7 bushels from 1995. Acreage harvested and to be harvested for grain is forecast at 73.3 million acres, unchanged from last month.

MONTANA'S SEPTEMBER 1, 1996 PASTURE AND RANGE FEED CONDITION

Dry weather continued to prevail in the state during August causing another significant decline in the pasture and range feed condition. Most areas of the state declined. The amount rated as good to excellent fell 21 points from a month ago. As of September 1, the condition was rated at 6% very poor, 30% poor, 36% fair, 25% good, and 3% excellent.
